there was a time not all that long ago when scientific study of the cell was called cytology and the workers in the field named themselves cytologists when i was a medical student lectures in cytology were a special segregated part of the curriculum in the histology course given along with general anatomy and they were as i recall the surest of cures for insomnia i still possess cowdry's three volume set entitled special cytology published in 1934 and leafing through these books today is rather like examining a medieval manuscript you could never have guessed what was going to happen to the field at that time it was all structure and all guesswork about the structure when cells were packed together in various tissues how did the geometry of packing work how many sides did a liver cell have in real life what on earth were all those granules inside and what were the best stains for looking at them one thing about those granules they never moved indeed nothing moved cytology turned into cell biology much later on and suddenly came alive as has been the case in so many disciplines in biology it was brought to life by techniques new instruments and cytochemical methods were devised for looking at cells manipulating cells more or less in vivo

about the series the consequences for diseases involving the immune system such as aids and chronic inflammatory diseases such as bronchial asthma rheumatoid arthritis and atherosclerosis now account for a considerable economic burden to governments worldwide in response there has been an enormous research effort investigating the basic mechanisms underlying such diseases and a tremendous drive to identify novel therapeutic applications for their prevention and treatment though a plethora of immunological studies have been published in recent years little has been written about the implications of such research for drug development as a consequence this area has not gained the prominence of other new fields such as molecular pharmacology or neuropharmacology and a focal information source for the many pharmacologists interested in diseases of the immune system remains unpublished the handbook of immunopharmacology series provides such a source through the commissioning of a comprehensive collection of volumes on all aspects of immunopharmacology editors have been sought after for each volume who are not only active in their respective areas of expertise but who also have a distinctly pharmacological bias to their research the series follows three

main themes each represented by volumes on individual component topics the first covers each of the major cell types and classes of inflammatory mediators cells and mediators the second covers each of the major organ systems and the diseases involving the immune and inflammatory responses that can affect them systems the third covers different classes of drugs currently used to treat these diseases as well as those under development drugs about the book this book addresses the key issues that face neutrophils during their very short but extremely important lives the discovery that neutrophils have the capacity to phagocytose and kill foreign organisms set the stage for a fascinating research field that continues to stimulate exciting new findings throughout the world neutrophils target the sites of infection or injury and are thus equipped with sensors for soluble signals chemoattractants generated in the tissue in response to tissue infection or injury and sensors for molecules on surfaces these receptors are important so that the cell can distinguish for example activated endothelium to stimulate adherence and emigration or alternatively the bacterial surface to stimulate phagocytosis and killing a deficiency in any of these mechanisms can result in life threatening infection an over reaction can result in damage to the tissues that the neutrophil should be programmed to protect
