this high quality laboratory manual may accompany any comparative anatomy text but correlates directly to kardong s vertebrates comparative anatomy function evolution text this text carefully guides students through dissections and is richly illustrated first and foremost the basic animal architecture is presented in a clear and concise manner this richly illustrated manual carefully guides students through dissections throughout the dissections the authors pause strategically to bring the students attention to the significance of the material they have just covered

an introduction to the brain's anatomical organization and functions with explanations in terms of evolutionary adaptations and development this introduction to the structure of the central nervous system demonstrates that the best way to learn how the brain is put together is to understand something about why it explains why the brain is put together as it is by describing basic functions and key aspects of its evolution and development this approach makes the structure of the brain and spinal cord more comprehensible as well as more interesting and memorable the book offers a detailed outline of the neuroanatomy of vertebrates especially mammals that equips students for further explorations of the field gaining familiarity with neuroanatomy requires multiple exposures to the material with many incremental additions and reviews thus the early chapters of this book tell the story of the brain's origins in a first run through of the entire system this is followed by other such surveys in succeeding chapters each from a different angle the book proceeds from basic aspects of nerve cells and their physiology to the evolutionary beginnings of the nervous system to differentiation and development motor and sensory systems and the structure and function of the main parts of the brain along the way it makes enlightening connections to evolutionary history and individual development brain structure and its origins can be used for advanced undergraduate or beginning graduate classes in neuroscience biology psychology and related fields or as a reference for researchers and others who want to know more about the brain

when i first urged richard shelton to write his naturalist's memoir i never expected him to produce a classic but he has redmond o hanlon author of trawler fish have been a lifelong obsession for richard shelton as a boy in the 1940s he was fascinated by what he found in the streams near his buckinghamshire home but it was the sea and the creatures living in it and by it which were to become his passion the longshoreman follows the author from stream to river from pond to lake and loch from shore to deep sea on a journey from childhood to an adulthood spent in boats in conditions fair and foul along the way this wonderful book introduces us to strange characters and the intimate habits of lobsters it also explains what it's like to be a lantern fish how some fish commute between the surface and the darkest depths when the laws of physics say they should be crushed to death and the fate of the wild salmon that heroic fish whose future is now imperilled by its farmed relatives a keen fisherman and wildfowler and an authority on marine life shelton has deeply held views on our relationship with the natural world and britain's with the seas which surround her

the hagfishes comprise a uniform group of some 60 species inhabiting the cool or deep parts of the oceans of both hemispheres they are considered the most primitive representatives of the group of craniate chordates which apart from the hagfishes that show no traces of verte brae includes all vertebrate animals consequently the hagfishes have played and still play a central role in discussions concerning the evolution of the vertebrates although most of the focus on hagfishes may be the result of their being primitive it should not be forgotten that at the same time they are specialized animals with a unique way of life that is interesting in its own right it is now more than 30 years since a comprehensive treatise on hagfishes was published the biology of myxine edited by alf brodal and ragnar fange universitetsforlaget oslo 1963 provided a wealth of information on the biology of hagfishes and over the years remained a major source of information and inspiration to students of hagfishes

as its title indicates this is a book for use in a practical comparative anatomy course it is intended for a somewhat unusual class of student and consequently its contents outlook and method of treatment are

unlike those of the standard texts in this subject as stated in the preface it is assumed that the student has already done a course in elementary zoology including the usual vertebrate types and has also examined in more detail a mammal unless this mammal were man a number of comparisons in the book would be missed to obtain full benefit from it the student should obviously have taken the preliminary medical studies including a fair amount of human anatomy this is not meant to imply that the student of advanced zoology cannot get many useful hints and fresh points of view from its pages he undoubtedly can the types treated in a series of regional dissections are the lamprey the dogfish *squalus nebulosus* the lizard and the dog as it is intended for assistance in dissection information regarding osteology and the details of the central nervous system have been purposely omitted and conversely the muscles are treated somewhat more fully than is customary
