discrete event simulation is a process oriented text reference that utilizes an eleven step model to represent the simulation process from problem formulation to implementation and documentation the book presents the necessary level of detail required to fully develop a model that produces meaningful results and considers the tools necessary to interpret those results sufficient background information is provided so that the underlying concepts of simulation are understood major topics covered in discrete event simulation include probability and distributional theory statistical estimation and inference the generation of random variates verification and validation techniques time management methods experimental design and programming language considerations the book also examines distributed simulation and issues related to distributing the physical process over a network of tightly coupled processors topics covered in this area include deadlock synchronization rollback event management and communication processes fully worked examples and numerous practical exercises have been drawn from the engineering disciplines and computer science although they have been structured so that they will be useful as well to other disciplines such as economics business administration and management science the presentation of techniques and methods in discrete event simulation make it an ideal text reference for all practitioners of discrete event simulation

in areas such as military security aerospace and disaster management the need for performance optimization and interoperability among heterogeneous systems is increasingly important model driven engineering a paradigm in which the model becomes the actual software offers a promising approach toward systems of systems sos engineering however model driven engineering has largely been unachieved in complex dynamical systems and netcentric sos partly because modeling and simulation m s frameworks are stove piped and not designed for sos composability addressing this gap netcentric system of systems engineering with devs unified process presents a methodology for realizing the model driven engineering vision and netcentric sos using devs unified process dunip the authors draw on their experience with discrete event systems specification devs formalism system entity structure ses theory and applying model driven engineering in the context of a netcentric sos they describe formal model driven engineering methods for netcentric m s using standards based approaches to develop and test complex dynamic models with dunip the book is organized into five sections section i introduces undergraduate students and novices to the world of devs it covers systems and sos

large scale simulation models algorithms and applications gives you firsthand insight on the latest advances in large scale simulation techniques most of the research results are drawn from the authors papers in top tier peer reviewed scientific conference proceedings and journals the first part of the book presents the fundamentals of large scale simulation including high level architecture and runtime infrastructure the second part covers middleware and software architecture for large scale simulations such as decoupled federate architecture fault tolerant mechanisms grid enabled simulation and federation communities in the third part the authors explore mechanisms such as simulation cloning methods and algorithms that support quick evaluation of alternative scenarios the final part describes how distributed computing technologies and many core architecture are used to study social phenomena reflecting the latest research in the field this book guides you in using and further researching advanced models and algorithms for large scale distributed simulation these simulation tools will help you gain insight into large scale systems across many disciplines

simulation is a controlled statistical sampling technique that can be used to study complex stochastic systems

when analytic and or numerical techniques do not suffice the focus of this book is on simulations of discrete event stochastic systems namely simulations in which stochastic state transitions occur only at an increasing sequence of random times the discussion emphasizes simulations on a finite or countably infinite state space develops probabilistic methods for simulation of discrete event stochastic systems emphasizes stochastic modeling and estimation procedures based on limit theorems for regenerative stochastic processes includes engineering applications of discrete event simulation to computer communication manufacturing and transportation systems focuses on simulations with an underlying stochastic process that can specified as a generalized semi markov process unique approach to simulation with heavy emphasis on stochastic modeling includes engineering applications for computer communication manufacturing and transportation systems

includes separately published extra sessions

this book constitutes the thoroughly refereed post conference proceedings of the 15th international workshop on multi agent based simulation mabs 2014 held in paris france in may 2014 the workshop was held in conjunction with the 13th international conference on autonomous agents and multiagent systems aamas 2014 the 17 revised full papers included in this volume were carefully selected from numerous submissions the papers are organized in topical sections on simulation methodologies simulation of social behaviour data and multi agent based simulation and applications
