logic circuits are becoming increasingly susceptible to probabilistic behavior caused by external radiation and process variation in addition inherently probabilistic quantum and nano technologies are on the horizon as we approach the limits of cmos scaling ensuring the reliability of such circuits despite the probabilistic behavior is a key challenge in ic design one that necessitates a fundamental probabilistic reformulation of synthesis and testing techniques this monograph will present techniques for analyzing designing and testing logic circuits with probabilistic behavior

the book presents reduction methods that are using tools from dynamical systems theory in order to provide accurate models for nonlinear dynamical solutions occurring in mechanical systems featuring either smooth or non smooth nonlinearities the cornerstone of the chapters is the use of methods defined in the framework of the invariant manifold theory for nonlinear systems which allows definitions of efficient methods generating the most parsimonious nonlinear models having minimal dimension and reproducing the dynamics of the full system under generic assumptions emphasis is put on the development of direct computational methods for finite element structures once the reduced order model obtained numerical and analytical methods are detailed in order to get a complete picture of the dynamical solutions of the system in terms of stability and bifurcation applications from the mems and aerospace industry are covered and analyzed geometric nonlinearity friction nonlinearity and contacts in jointed structures detection and use of internal resonance electromechanical and piezoelectric coupling with passive control parametric driving are surveyed as key applications the connection to digital twins is reviewed in a general manner opening the door to the efficient use of invariant manifold theory for nonlinear analysis design and control of engineering structures

structural design sensitivity analysis concerns the relationship between design variables available to the design engineer and structural responses determined by the laws of mechanics the dependence of response measures such as displacement stress strain natural frequency buckling load acoustic response frequency response noise vibration harshness nvh thermo elastic response and fatigue life on the material property sizing component shape and configuration design variables is defined through the governing equations of structural mechanics in this 2 volume set first and second order design sensitivity analyses are presented for static and dynamics responses of both linear and nonlinear elastic structural systems including elasto plastic and frictional contact problems book i introduces structural design concepts that include the cad based design model design parameterization performance measures costs and constraints it also discusses
