this volume deals with two complementary topics on one hand the book deals with the problem of determining the the probability distribution of a positive compound random variable a problem which appears in the banking and insurance industries in many areas of operational research and in reliability problems in the engineering sciences on the other hand the methodology proposed to solve such problems which is based on an application of the maximum entropy method to invert the laplace transform of the distributions can be applied to many other problems the book contains applications to a large variety of problems including the problem of dependence of the sample data used to estimate empirically the laplace transform of the random variable contents introduction frequency models individual severity models some detailed examples some traditional approaches to the aggregation problem laplace transforms and fractional moment problems the standard maximum entropy method extensions of the method of maximum entropy superresolution in maxentropic laplace transform inversion sample data dependence disentangling frequencies and compounding losses computations using the maxentropic density review of statistical procedures

this book presents the applications of fractional calculus fractional operators of non integer orders and fractional differential equations in describing economic dynamics with long memory generalizations of basic economic concepts notions and methods for the economic processes with memory are suggested new micro and macroeconomic models with continuous time are proposed to describe the fractional economic dynamics with long memory as well
