the present work reflects a multi disciplinary effort to address the
topic of confined hydrosystems developed with a cross fertilization
panel of physics chemists biologists soil and earth scientists
confined hydrosystems include all situations in natural settings
wherein the extent of the liquid phase is limited so that the solid
liquid and or liquid air interfaces may be critical to the
properties of the whole system primarily this so called residual
solution is occluded in pores channels in such a way that decreases
its tendency to evaporation and makes it long lasting in arid earth
deserts and hyper arid mars soils areas the associated physics is
available from domains like capillarity adsorption and wetting and
surface forces however many processes are still to understand due to
the close relationship between local structure and matter properties
the subtle interplay between the host and the guest the complex

intermingling among static reactivity and migration pathway expert contributors from israel russia europe and us discuss the behaviour of water and aqueous solutes at different scale from the nanometric range of carbon nanotubes and nanofluidics to the regional scale of aquifers reactive flow in sedimentary basins this scientific scope allowed the group of participants with very different background to tackle the confinement topic at different scales the book is organized according to four sections that include i flow from nano to mega scale ii ions hydration and transport iii in pores channels cavitation iv crystallization under confinement most of contributions relates to experimental works at different resolution interpreted through classic thermodynamics and intermolecular forces simulation techniques are used to explore the atomic scale of interfaces and the migration in the thinnest angstrom wide channels
