aircraft design processes require extensive work in the area of both aerodynamics and structure forming an environment for aeroelasticity investigations present and future designs of european aircraft are characterized by an ever increasing aircraft size and performance strong weight saving requirements are met by introduction of new materials leading to more flexible structure of the aircraft consequently aeroelastic phenomena such as vortex induced aeroelastic oscillations and moving shock waves can be predominant and may have a significant effect on the aircraft performance hence the ability to estimate reliable margins for aeroelastic instabilities flutter or dynamic loads buffeting is a major concern to the aircraft designer as modern aircrafts have wing bending modes with frequencies that are low enough to influence the flight control system demands on

unsteady aerodynamics and structural analysis to predict flight control effectiveness and riding comfort for passengers are extremely high therefore the aircraft industries need an improved capacity of robust accurate and reliable prediction methods in the coupled aeroelastic flight mechanics and loads disciplines in particular it is necessary to develop improve and calibrate the numerical tools in order to predict with high level of accuracy and capability complex and non classical aeroelastic phenomena including aerodynamic non linearities such as shock waves and separation as well as structural non linearities e g control surface free play nowadays robust methods for structural analysis and linearised unsteady aerodynamics are coupled and used by the aircraft industry to computationally clear a new design from flutter
