riemannian topology and structures on manifolds results from a similarly entitled conference held on the occasion of charles p boyer s 65th birthday the various contributions to this volume discuss recent advances in the areas of positive sectional curvature $k \geq 1$ hler and sasakian geometry and their interrelation to mathematical physics especially m and superstring theory focusing on these fundamental ideas this collection presents review articles original results and open problems of interest

the theory of J holomorphic curves has been of great importance since its introduction by Gromov in 1985 in mathematics its applications include many key results in symplectic topology it was also one of the main inspirations for the creation of Floer homology in mathematical physics it provides a natural context in which to define Gromov-Witten invariants and quantum cohomology two important ingredients of the mirror symmetry conjecture the main goal of this book is to establish the fundamental theorems of the subject in full and rigorous detail in particular the book contains complete proofs of Gromov's compactness theorem for spheres of the gluing theorem for spheres and of the associativity of quantum multiplication in the semipositive case the book can also serve as an introduction to current work in symplectic topology there are two long chapters on applications one concentrating on classical results in symplectic topology and the other concerned with quantum cohomology the last chapter sketches some recent developments in Floer theory the five appendices of the book provide necessary background related to the classical theory of linear elliptic operators Fredholm theory Sobolev spaces as well as a discussion of the moduli space of genus zero stable curves and a proof of the positivity of intersections of J holomorphic curves in four dimensional manifolds the second edition clarifies various arguments corrects several mistakes in the first edition includes some additional results in chapter 10 and appendices C and D and updates the references to recent developments

in the last decade the development of new ideas in quantum theory including geometric and deformation quantization the non abelian Berry's geometric factor super and BRST symmetries non commutativity has called into play the geometric techniques based on the deep interplay between algebra differential geometry and topology the book aims at being a guide to advanced differential geometric and topological methods in quantum mechanics their main peculiarity lies in the fact that geometry in quantum theory speaks mainly the algebraic language of rings modules sheaves and categories geometry is by no means the primary scope of the book but it underlies many ideas in modern quantum physics and provides the most advanced schemes of quantization

the main object of this book is to reorient and revitalize classical geometry in a way that will bring it closer to the mainstream of contemporary mathematics the postulational basis of the subject will be radically revised in order to construct a broad scale and conceptually unified treatment the familiar figures of classical geometry points segments lines planes triangles circles and so on stem from problems in the physical world and seem to be conceptually unrelated however a natural setting for their study is provided by the concept of convex set which is comparatively new in the history of geometrical ideas the familiar figures can then appear as convex sets boundaries of convex sets or finite unions of convex sets moreover two basic types of figure in linear geometry are special cases of convex set linear space point line and plane and halfspace ray halfplane and halfspace therefore we choose convex set to be the central type of figure in our treatment of geometry how can the wealth of geometric knowledge be organized around this idea by definition a set is convex if it contains the segment joining each pair of its points that is if it is closed under the operation of joining two points to form a segment but this is precisely the basic operation in Euclid
