memcomputing is a new computing paradigm that employs time non locality memory to both process and store information this book written by the originator of this paradigm explains the main ideas behind memcomputing explores its theoretical foundations and shows its applicability to a wide variety of combinatorial optimization problems machine learning and quantum mechanics the book is ideal for

graduate students in physics computer science electrical engineering and mathematics as well as researchers in both academia and industry interested in unconventional computing the author relies on extensive margin notes important remarks and many illustrations to better explain the main concepts and clarify jargon making the book as self contained as possible the reader will be guided from the basic notions to the more advanced ones with an always clear and engaging writing style along the way the reader will appreciate the advantages of this computing paradigm and the major differences that set it apart from the prevailing turing model of computation and even quantum computing

this volume contains the proceedings of the workshop on topology held at the pontificia universidade catolica in rio de janeiro in january 1992 bringing together about one hundred mathematicians from brazil and around the world the workshop covered a variety of topics in differential and algebraic topology including group actions foliations low dimensional topology and connections to differential geometry the main concentration was on foliation theory but there was a lively exchange on other current topics in topology the volume contains an excellent list of open problems in foliation research prepared with the participation of some of the top world experts in this area also presented here are two surveys on group actions finite group actions and rigidity theory for anosov actions as well as an elementary survey of thurston s geometric topology in dimensions 2 and 3 that would be accessible to advanced undergraduates and graduate students

with contributions by leading experts in geometric analysis this volume is documenting the material presented in the john h barrett memorial lectures held at the university of tennessee knoxville on may 29 june 1 2018 the central topic of the 2018 lectures was mean

this volume offers a fundamentally different way of conceptualizing time and reality today we see time predominantly as the linear sequential order of events and reality accordingly as consisting of facts that can be ordered along sequential time but what if this conceptualization has us mistaking the exhausts for the real thing i.e. if we miss the best the actual taking place of reality as it occurs in a very differently structured primordial form of time the time space of the present in this new conceptual framework both the sequential aspect of time and the factual aspect of reality are emergent phenomena that come into being only after reality has actually taken place in the new view facts are just the traces that the actual taking place of reality leaves behind on the co emergent canvas of local spacetime local spacetime itself emerges only as facts come into being and only facts can be adequately localized in it but how does reality then actually occur it is conceived as a constellatory self unfolding characterized by strong self referentiality and taking place in the primordial form of time the not yet sequentially structured time space of the present time is seen here as an ontophanetic platform i.e. as the stage on which reality can first occur this view of time and thus also space seems to be very much in accordance with what we encounter in quantum physics before the so called collapse of the wave function in parallel classical and relativistic physics largely operate within the factual portrait of reality and the sequential aspect of time respectively only singularities constitute an important exemption here the canvas of local spacetime that emerged together with factization melts down again in the novel framework quantum

reduction and singularities can be seen and addressed as inverse transitions in quantum physical state reduction reality gains the chrono ontological format of facticity and the sequential aspect of time becomes applicable in singularities by contrast the inverse happens reality loses its local spacetime formation and reverts back into its primordial pre local shape making in this way the use of causality relations boolean logic and the dichotomization of subject and object obsolete for our understanding of the relation between quantum and relativistic physics this new view opens up fundamentally new perspectives both are legitimate views of time and reality they just address very different chrono ontological portraits and thus should not lead us to erroneously subjugating one view under the other the task of the book is to provide a formal framework in which this radically different view of time and reality can be addressed properly the mathematical approach is based on the logical and topological features of the borromean rings it draws upon concepts and methods of algebraic and geometric topology especially the theory of sheaves and links group theory logic and information theory in relation to the standard constructions employed in quantum mechanics and general relativity shedding new light on the pestilential problems of their compatibility the intended audience includes physicists mathematicians and philosophers with an interest in the conceptual and mathematical foundations of modern physics
