this book intends to provide material for a graduate course on computational commutative algebra and algebraic geometry highlighting potential applications in cryptography also the topics in this book could form the basis of a graduate course that acts as a segue between an introductory algebra course and the more technical topics of commutative algebra and algebraic geometry this book contains a total of 124 exercises with detailed solutions as well as an important number of examples that illustrate definitions theorems and methods this is very important for students or researchers who are not familiar with the topics discussed experience has shown that beginners who want to take their first steps in algebraic geometry are usually discouraged by the difficulty of the proposed exercises and the absence of detailed answers therefore exercises and their solutions as well as examples occupy a prominent place in this course this book is not designed as a comprehensive reference work but rather as a selective textbook the many exercises with detailed answers make it suitable for use in both a math or computer science course

basic algebra and advanced algebra systematically develop concepts and tools in algebra that are vital to every mathematician whether pure or applied aspiring or established advanced algebra includes chapters on modern algebra which treat various topics in commutative and noncommutative algebra and provide introductions to the theory of associative algebras homological algebras algebraic number theory and algebraic geometry together the two books give the reader a global view of algebra its role in mathematics as a whole and are suitable as texts in a two semester advanced undergraduate or first year graduate sequence in algebra
