el comandante amberson había hecho una fortuna en 1873 cuando otra gente estaba perdiendo la suya y ahí empezó la magnificencia de los amberson así

empieza los magníficos amberson la obra maestra y segunda entrega de su aclamada trilogía growth que ha sido llevada al cine y a la televisión en numerosas ocasiones la familia amberson es la más poderosas y rica del lugar y el joven george amberson minifer nieto del patriarca es terriblemente consentido por su madre isabel arrogante hasta la indecencia seguro de su posición y valor y totalmente ignorante de los sentimientos de los demás george se enamora en un baile de lucy morgan una joven hermosa pero también sensible e inteligente a medida que el pueblo se convierte en una ciudad industrial la riqueza de los amberson mengua y crece la de los morgan gracias al ingenio del padre de lucy george se enterará inevitablemente de la vieja historia de amor entre su madre y el padre de ella para salvar el buen nombre de su familia george decide interponerse entre ellos su ataque a morgan significará renunciar a lucy para siempre y lo que es aún peor la destrucción de su mundo la historia tiene lugar en un ficticio indianapolis y describe el crecimiento de los estados unidos a través del ascenso y declive de la familia amberson durante tres generaciones entre el final de la guerra civil y la primera parte del siglo xx un período de industrialización creciente que produjo numerosos cambios en la sociedad y economía americana el declive de los ambersons contrasta con las nuevas fortunas de los grandes industriales y otras familias acaudaladas cuyo poder no surge de su apellido sino de su actividad

el propósito de este libro es fundamentalmente dar esperanza a aquéllos que atraviesan por la misma situación que una vez vivió la autora darielys tejera pretende además sacar a la luz una historia con la cual el lector pueda identificarse y crear una conciencia entre los demás de que el suicidio sí ocurre y que cuando ocurre la víctima nunca está sola porque hay muchos que pasan por lo mismo a algunos se les dan talentos mientras que otros tienen que encontrar por sí solos su razón de ser mis talentos los descubrí mi razón de ser la tuve que buscar hasta que la encontré mi razón de ser era y es ayudar a otros por eso decidí escribir este libro creo que todos estamos en este mundo para en un momento u otro de una manera o otra salvar a alguien aunque no siempre tengamos conciencia de ello

una de las preguntas fundamentales que miles de millones de hombres se han hecho a lo largo de la historia de la humanidad es si dios existe quien es el como se le puede conocer como se lo puede imaginar como se le puede hablar es dios una categoria mental mas de las tantas que creamos y por lo tanto es producto de nuestra imaginacion o ese dios existe realmente y se ha comunicado con nosotros de alguna manera verificable objetiva y nos ha revelado algo de quien es el y a estos interrogantes se le anade la inseparable duda de si lo que afirmarnos de dios es realmente lo que el es este interrogante ha sido motivo de innumerables confrontaciones entre los que afirman que si se ha dado dicha comunicacion y los que afirman que ese dios no nos ha hablado nunca y que por lo tanto es producto de nuestra imaginacion de nuestro deseo de sentirnos protegidos de sentirnos cobijados de sentirnos especiales cuando nos damos cuenta que somos varios billones de humanos viviendo en este punto azul la tierra suspendida en el firmamento compartiendo

el espacio con miles y miles de estrellas de nuestra galaxia y esta a su vez acompañada por miles de otras galaxias ejecutando el baile cósmico de nuestro universo es pues necesario hacer una revisión histórica crítica y de fondo para averiguar si existe o se ha dado la posibilidad de una comunicación entre este ser dios y nosotros la humanidad y si ha ocurrido de que manera se ha hecho dicha comunicación y si se ha dado que nos ha dicho dios de si mismo que nos sirva para hacernos una imagen comprensible de quien es el de cual es su íntima esencia

cd rom water availability is one of the main limiting factors that control ecosystem functions and productivity in semiarid regions vegetation of these regions usually presents a patchy distribution where sparse plant cover is interspersed over a bare soil during the few rainfall events runoff is generated in non vegetated areas and redistributed towards vegetation which act as surface obstruction for water sediments and nutrients thus non vegetated areas are more susceptible to water erosion processes non vegetated areas from semiarid ecosystems around the world are often covered by biological soil crusts bscs bscs result from an intimate association between soil particles and cyanobacteria algae microfungi lichens and bryophytes these communities live within or immediately on top of the uppermost millimeters of soil influencing soil surface properties involved in infiltration runoff generation and water erosion several papers have demonstrated that bscs are one of the most important soil stabilizing factors in drylands there are however contradictory results on the role that bscs play in regulating soil water fluxes some studies point bscs as runoff sources that may increase downslope erosion or on the contrary may represent an additional supply of water for downslope vegetation allowing its survival the impact of this additional runoff should be evaluated at less detailed scales than the patch and to analyze all interactions in terms of water sediments and nutrients between areas covered by bscs and vegetated patches in order to establish the real effects of bscs on both runoff and erosion also to correctly predict the impact of future climate changes or anthropic disturbances on hydrological behavior and water erosion in systems dominated by bscs their effects should be included on spatially distributed runoff and erosion models until now the influence of bscs on these processes has been addressed almost exclusively at patch scale despite the fact some authors have pointed the need of upscaling their effects and even more their influence on runoff generation and water erosion was never considered in spatially implicit modelling the goal of this thesis is to determine bsc effects on runoff and water erosion from plot to catchment scale in a typical semiarid ecosystem to achieve this objective first direct and indirect effects of bscs at patch scale must be clearly defined under natural rainfall conditions to solve the controversy about bscs effects on runoff generation to know the direct and indirect relationships among soil surface characteristics bsc cover and type topography rainfall characteristics duration amount and intensity and runoff structural equation models sem were applied our results reveal the critical importance of bscs on runoff and water erosion both processes in biologically crusted areas are directly controlled by crust type and cover bscs also modified some soil surface properties involved in runoff generation and water erosion such as microtopography surface stability or water repellency the final interaction of both

direct and indirect bscs effects determine the hydrological behavior of these surfaces under natural rainfall conditions moreover the final effect of bscs on runoff generation is strongly driven by rainfall properties which determined the set of complex interactions among bscs type and developmental stage and soil surface properties on one hand during low intensity rains bsc induced microtopography increases the amount of surface micro depressions which act as temporal water sinks reducing the connectivity among source areas delaying runoff initiation and reducing runoff rates on the other hand during intense rainfall events bscs type and water repellency are the main factors determining runoff generation when the effects of bscs are analyzed at coarser scales including all interactions among bscs and vegetated areas on a whole catchment our results reveal the importance of the interactions between areas with bscs and areas with vegetation on runoff generation and water erosion we show the capacity of vegetated areas to retain runoff waters generated by upslope biologically crusted areas as an important driver for the hydrological and erosional response at catchment scale however the capability of vegetated areas to trap and retain water and sediments is limited and can be exceeded during high magnitude events increasing catchment connectivity as well as runoff and water erosion at the catchment outlet even during high magnitude events when the runoff generated in bsc areas reaches the channel network the local protection provided by bscs also affects downslope areas and the catchment response these results confirm that bscs must be included in runoff and soil erosion models to obtain reliable predictions of the spatial pattern of runoff and water erosion in catchments with abundant bscs in order to correctly introduce the effects of bscs in these models it is necessary to have an accurate spatial characterization of bscs it is shown that a spectral mixture analysis is required for the precise characterization of the complex spatial distribution of bscs due to the intrinsic spatial heterogeneity of semiarid ecosystems and to the spectral similarities among bscs dry vegetation and bare soil due to the methodological and practical application problems of spectral mixture analysis when it is applied to spectrally complex areas or when some surface elements only appear in specific areas of the image we needed to develop a novel methodology for bscs classification and quantification lichen and cyanobacteria dominated cbs based on hyperspectral images support vector machine classification was applied for spectral and ecological classification of homogenous areas to solve the mentioned problems inherent to spatial heterogeneity immediately afterwards spectral mixture analysis sma was applied to each svm class to quantify the proportion of each type of surface cover within each pixel relative abundance images obtained with this methodology achieve a relatively high accuracy for different types of bscs and have demonstrated to be an adequate source of spatially distributed information to correctly characterize surface properties in biologically crusted drylands systems moreover to have the spatial distribution of type and abundance of bscs allows to increase the accuracy of modeled runoff and erosion thus when bscs effects are not included in the lisem model an important increase in modeled water erosion was observed in areas where bscs was not considered

el principal motivo de escribir este libro es sencillamente para llamar la atención del amable lector en cuanto a la cruda realidad que a vivido siempre nuestra América Latina a través de los siglos es una historia de sufrimiento de atraso y abandono en que hemos vivido por culpa en parte nuestra pero más que todo por influencias y presiones exteriores que no hemos querido o no hemos sabido rechazar este libro pues es una mirada general a través de los 500 años de existencia como pueblos civilizados desde la conquista época colonial hasta nuestros días es una pequeña evaluación del desenvolvimiento cultural social político y religioso de nuestros pueblos americanos espero que el amable lector al terminar su lectura o durante la misma me dispense su atención y reflexione un poco y piense si tengo o no razón muchas gracias por su amable atención el autor
