active neuroscientists survey nscs as potential tools for central nervous system and spinal cord repair by explaining their clinically significant fundamental properties manipulations and potential therapeutic paradigms their discussion of the fundamental biology of nscs illustrates the signaling pathways that regulate stem cell division and differentiation and defines the methods of nsc expansion and propagation neuromorphogenesis the factors determining cell fate both in vitro and in situ and the induction of self reparative processes within the brain they also present strategies that may lead to fruitful clinical applications in the near future these range from the replacement of degenerated dysfunctional or maldeveloped cells to the provision of factors that may protect correct recruit promote self repair or mediate the connectivity of host cells

the nervous system is the product of biological evolution and is shaped by the interplay between extrinsic factors determining the ecology of animals and by intrinsic processes that dictate the developmental rules that give rise to adult functional structures this special topic is oriented to develop an integrative view from behavior and ecology to neurodevelopmental processes we address questions such as how do sensory systems evolve according to ecological conditions how do neural networks organize to generate adaptive behavior how does cognition and brain connectivity evolve what are the developmental mechanisms that give rise to functional adaptation accordingly the book is divided in three sections i evolution of sensorimotor systems ii cognitive computations and neural circuits and iii development and brain evolution we hope that this initiative will support an interdisciplinary program that addresses the nervous system as a unified organ subject to both functional and developmental constraints where the final outcome results of a compromise between different parameters rather than being the result of several single variables acting independently of each other

two noted researchers explain scientific evidence that shows why certain experiential and lifestyle factors may promote and maintain cognitive vitality in older adults although our physical abilities clearly decline as we age cognitive decline in healthy old age is neither universal nor inevitable in nurturing the older brain pamela greenwood and raja parasuraman show that scientific research does not support the popular notion of the inexorable and progressive effects of cognitive aging in all older adults they report that many adults maintain a high level of cognitive function into old age and that certain experiential and lifestyle factors including education

exercise diet and opportunities for new learning contribute to the preservation of cognitive abilities many popular accounts draw similar conclusions and give similar lifestyle advice but lack supporting scientific evidence greenwood and parasuraman offer a comprehensive review of research on cognitive and brain aging they show that even the aged brain remains capable of plasticity the ability to adapt to and benefit from experience and they summarize evidence that brain plasticity is heightened by certain types of cognitive training by aerobic exercise and by certain diets they also report on the somewhat controversial use of estrogen and cognition enhancing drugs on environmental adaptations including virtual assistants that help older adults age in place and on genetic factors in cognitive aging the past twenty years of research points to ways that older adults can lead rich and cognitively vital lives as millions of baby boomers head toward old age greenwood and parasuraman s accessible book could not be more timely

the evolution of the human brain and cognitive ability is one of the central themes of physical biological anthropology this book discusses the emergence of human cognition at a conceptual level describing it as a process of long adaptive stasis interrupted by short periods of cognitive advance these advances were not linear and directed but were acquired indirectly as part of changing human behaviors in other words through the process of exaptation acquisition of a function for which it was not originally selected based on studies of the modern human brain certain prerequisites were needed for the development of the early brain and associated cognitive advances this book documents the energy and nutrient constraints of the modern brain highlighting the significant role of long chain polyunsaturated fatty acids lc pufa in brain development and maintenance crawford provides further emphasis for the role of essential fatty acids in particular dha in brain development by discussing the evolution of the eye and neural systems this is an ideal book for graduate students post docs research scientists in physical biological anthropology human biology archaeology nutrition cognitive science neurosciences it is also an excellent selection for a grad student discussion seminar
