the clean development mechanism cdm is widely regarded as one of the kyoto protocol s best creations and as an essential part of the international climate change regime the cdm has been constantly evolving to ensure that it fulfils its objectives of mitigating climate change and contributing to sustainable development in developing countries the over 6 000 registered projects under the cdm are estimated to have generated almost us 200 billion of investment in developing countries and are expected to achieve ghg emission reductions of about 6 8 billion tonnes nevertheless the cdm is not perfect and one of its main problems is the inequitable geographic distribution of projects among developing countries understandably this is a problem that countries are very keen to address and since 2001 even before the first project was registered countries have been highlighting the need to ensure that projects are equitably distributed among participating countries this book looks at distributive justice under the cdm regime and focuses on the issue of equity in the geographic distribution of cdm projects among developing countries the book investigates relevant aspects of international law to identify the legal characteristics of equitable distribution or distributive justice in order to establish what equitable distribution in the cdm should look like based on these investigations tomilola akanle eni ibukun breaks new ground in defining equitable distribution under the cdm and exploring how key obstructions to the equitable distribution of projects may be overcome the book

will be of particular interest to academics and policymakers of climate change and the cdm within international law

many books on reliability focus on either modeling or statistical analysis and require an extensive background in probability and statistics continuing its tradition of excellence as an introductory text for those with limited formal education in the subject this classroom tested book introduces the necessary concepts in probability and statistics within the context of their application to reliability the third edition adds brief discussions of the anderson darling test the cox proportionate hazards model the accelerated failure time model and monte carlo simulation over 80 new end of chapter exercises have been added as well as solutions to all odd numbered exercises moreover excel workbooks available for download save students from performing numerous tedious calculations and allow them to focus on reliability concepts ebeling has created an exceptional text that enables readers to learn how to analyze failure repair data and derive appropriate models for reliability and maintainability as well as apply those models to all levels of design

this book uses new data from the very low radio frequency telescope lofar to analyse the magnetic structure in the giant radio galaxy ngc6251 this analysis reveals that the magnetic field strength in the locality of this giant radio galaxy is an order of magnitude lower than in other comparable systems due to the observational limitations associated with capturing such huge astrophysical structures giant radio galaxies are historically a poorly sampled population of objects however their preferential placement in the more rarefied regions of the cosmic web makes them a uniquely important probe of large scale structures in particular the polarisation of the radio emissions from giant radio galaxies is one of the few tools available to us that can be used to measure magnetic fields in regions where the strength of those fields is a key differentiator for competing models of the origin of cosmic magnetism low frequency polarisation data are crucial for detailed analyses of magnetic structure but they are also the most challenging type of observational data to work with this book presents a beautifully coupled description of the

technical and scientific analysis required to extract valuable information from such data and as the new generation of low frequency radio telescopes reveals the larger population of giant radio galaxies it offers a significant resource for future analyses

this publication provides insight into the possible scale and features of the main drivers along with case studies

graphs express relationships among objects such as the radio connectivity among nodes in unmanned vehicle swarms some applications may rank a swarm's nodes by their relative importance for example using the pagerank algorithm applied in certain search engines to order query responses the pagerank values of the nodes correspond to a unique eigenvector that can be computed using the power method an iterative technique based on matrix multiplication the first result is a practical lower bound on the pagerank algorithm's execution time that is derived by applying assumptions to the pagerank perturbation's scaling value and the pagerank vector's required numerical precision the second result establishes nodes contained in the same block of the graph's coarsest equitable partition must have equal pagerank values the third result the averagerank algorithm ensures such nodes are assigned equal pagerank values the fourth result the productrank algorithm reduces the time needed to find the pagerank vector by eliminating certain dot products in the power method if the graph's coarsest equitable partition contains blocks composed of multiple vertices the fifth result the quotientrank algorithm uses a quotient matrix induced by the coarsest equitable partition to further reduce the time needed to compute a swarm's pagerank vector
