essay from the year 2016 in the subject health public health grade 1 egerton university language english abstract over the years exercise science has evolved to introduce new dimensions into the way energy is utilized in the body during sports activities such as athletics cycling and swimming endurance for long hours is necessary for the maintenance of high muscle activity ordinarily body muscles are responsible for generating chemical energy which is utilized during physical activity therefore energy reserves in the body tend to be depleted especially after prolonged exposure to strenuous exercise such as running this applies to sprinters as well as long distance runners this phenomenon is also experienced by people who engage in strenuous physical exercise rather than sports on the other hand strenuous exercises including sporting activities involve a high level of dehydration this leads to a significant loss of body fluids as well as salts these factors have prompted sporting people to look for remedies for energy depletion and dehydration in order to maintain endurance in physical activities such as athletics in theory these remedies are referred to as ergogenic aids an ergogenic aid can be defined as a mechanical physical psychological nutritional or a pharmacological substance that either limits physiological capacity by removing subjective restraints or directly enhances physiological variables in the body especially those related to exercise performance according to the definition of ergogenic aids it is apparent that steroids are considered some of the most principal ergogenic compounds which can be used in sports this is so because steroids tend to increase muscle activity especially during

strenuous exercises ordinarily steroids have been in clinical use as pharmacological substances for the treatment of an array of health conditions they have also been used as nutritional supplements for enhancing hormone production and alleviation of anxiety this implies that steroids possess psychological functions in the body as such steroids are ergogenic aids and this is why athletes are prohibited from taking steroids because they alter their actual performance by providing them with a competitive advantage it is believed that steroids enhance exercise performance more or less the same as other pharmacological ergogenic aids
