although biodiversity is a relatively new coinage scientists have been studying

the subject it describes long before the word's first appearance in the language in the mid 1980s in 1973 for instance the UK Systematics Association held a symposium on the changing flora and fauna of Britain which concluded that not enough attention was being paid to the conservation of rarities a conclusion also reached said the symposium at a meeting of the Linnaean Society some forty years earlier by 1980 the Global 2000 report to the President published by the US Council on Environmental Quality starkly warned of a diminution of up to one fifth of all species by the turn of the century and there is now a growing consensus that the world faces a biodiversity crisis a potentially catastrophic global loss of genetic ecosystem and most obviously species diversity indeed especially since the UN Convention on Biological Diversity was promulgated in Rio de Janeiro in 1992 conserving biodiversity has become the principal focus of the global conservation movement indeed the study of the origins maintenance and protection of diversity has become perhaps the most vibrant offshoot of ecology and conservation studies it is increasingly taught and studied in universities and other research institutions around the world addressing the need for an authoritative reference work to make sense of this rapidly growing subject and its ever more complex and multidisciplinary corpus of scholarly literature biodiversity and conservation is a new title in the Routledge series Critical Concepts in the Environment edited by Richard Liddle of Oxford University's Centre for the Environment this new major work brings together in five volumes the foundational and the very best cutting edge scholarship to provide a synoptic view of all the key issues and current debates

volume 2

this is the latest book in the Natural Heritage of Scotland series from Scottish Natural Heritage SNH the book contains the papers read at SNH's 2008 conference on the subject and provides the reader with valuable high quality up to date information and research on the subject interspersed with stunning full colour images the long term aim for all species management is for thriving and self

sustaining self regulating populations of native species throughout their natural ranges the challenge is to achieve this in the face of increasing pressures from developments exploitation habitat loss and climate change this book explores the challenges and solutions to species management for species conservation the control of invasive non native species resolving conflicts of interest between native species and the sustainable use of species with contributions from a range of international experts including scientists conservationists and managers

an illustrated overview of the different habitats found around the world and the animals which occupy them

this latest volume remains the only book available that focuses on the medical problems of captive and free ranging wildlife it features the most current information following the approach and format of previous volumes and conveniently cross indexed to volume 3

this volume explores three major areas of research on predatory mammals physiological adaptations predatory tactics and management dilemmas resulting from predation that upsets ecological balance or human activities contributors discuss the cases of many different types of animals from otters and badgers to lions and leopards the big cats for example are included in the context of studies of cattle mortality in kenya and venezuela and other countries other chapters discuss problems caused by fish eating mammals near coastal scotland disease carrying birds urban foxes and many equally insightful cases the book will interest all ecologists zoologists and conservationists concerned with issues relating to the predatory habits of wildlife around the world
