the feasibility of using helium jets as a practical substitute for actual rockets in scale model acoustic tests was investigated by conducting an experimental program with four heated helium models sufficient evidence is presented to indicate that the substitute gas modeling concept is valid i e simulation of rocket noise can be achieved if the essential rocket flow parameters are duplicated it is not possible to duplicate all flow parameters simultaneously and retain the essential feature of simplicity compromises must be made the helium model performed best this evaluation is based on agreement in sound pressure levels with a small solid propellant rocket an investigation was made to determine the effect of flight vehicle motion on propulsion system noise propagated to parts of the vehicle located in the near field experiments were performed using a 0.6 in diameter

heated air jet operating in a 16 in diameter acoustically treated wind tunnel experimental results compare favorably with predictions based on the hypothesis which explains the effect of vehicle motion by two separate factors the noise produced by a jet in motion depends on the relative velocity between the jet and the air through which it moves and a shifting of the noise radiation pattern toward the rear occurs because of combined effects of vehicle motion and the finite velocity of sound
