sequence and creates a complementary mRNA strand. This mRNA molecule carrying the genetic instructions then detaches from the DNA and leaves the nucleus. Translation: mRNA reaches the ribosomes, the protein synthesis machinery of the cell. Ribosomes bind to the mRNA and read its codons, three-nucleotide sequences that specify particular amino acids. Transfer RNA (tRNA), each carrying a specific amino acid, recognizes and binds to the mRNA codons. Ribosomes link the amino acids brought by tRNAs, forming a polypeptide chain according to the mRNA sequence. The polypeptide chain folds into a three-dimensional structure, forming the final functional protein. In essence, DNA provides the genetic code, which is transcribed into mRNA and then translated into a protein. This intricate process ensures that the correct amino acid sequence is incorporated into the protein, guaranteeing its proper function within the cell. Continue with similar detailed explanations for all the review questions covering the relevant scientific concepts, principles, and applications. Note: This is a template.
