traditional means of data gathering are inadequate for present purposes in hydrology and water management thus hydrologists are urgently seeking new ways for supplementing their conventional data supplies satellite remote sensing is being explored increasingly as one possible answer to such data acquisition problems both because of its perceived facility for providing greatly improved space and time coverage of key hydrological observation systems and because the technologies of data acquisition transmission and processing have become more advanced and more capable although the use of remote sensing especially from satellites is currently less well developed in these contexts than in support of many other earth resource and environmental sciences much successful hydrological research has already been based upon satellite data and in limited but important ways satellite data have already begun to be used in water monitoring and management operations

published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 47 there are a number of reasons for organizing a symposium one is to bring specialists together to discuss a specific problem in which they all have expertise and encourage the participants to talk openly about their current work which in all likelihood is not going to be in publishable form for some time another reason might be that a problem has been identified by one group of experts which needs the input from a previously loosely allied group before real progress can be made the International Union of Geodesy and Geophysics Symposium U.S. Hydrogeological Regimes and their Subsurface Thermal Effects organised for the August 1987 General Assembly in Vancouver was a symposium of the latter type
