excerpt from practical physics for nurses the criticism is often made that nurses are not intelligent about the handling of ordinary household and hospital appliances and that they make no attempt to understand the workings of plumbing heating and ventilating apparatus surgical instruments and appa ratus etc the fault lies not so much in the nurse herself nor m any lack of inclination to learn as it does in the fact that she has not been taught the laws which govern some of the simplest activities of life very many nurses are not high school graduates and of those who are not all have studied physics nor know how to apply their knowledge to nursing about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

this very basic textbook aims to provide nursing students with the essential bioscience they will need to complete their common foundation programme the book will explore the relevant basic scientific principles apply these principles to clinical situations and then ask review questions for anyone who has not studied science before this will be an excellent introduction to the key concepts of chemistry physics and biology as applied to nursing

an additional assumption was that the processes for theory development were new to nursing and hence nurses in graduate programs learned strategies for advancing knowledge from other disciplines this assumption was debunked with the knowledge that nurses were always engaged in knowledge development driven by their experiences in clinical practice because of these assumptions most of the early writing about theory development was about outlining strategies that should be used rather than strategies that have already been used in the discipline to develop theories theorists themselves did not uncover or adequately discuss ways by which they developed their theories therefore the tendency was to describe processes that were based on theories developed in other disciplines mainly the physical and social sciences and an implicit assumption was made that there should be a single strategy for theory development some claiming to begin the process from practice and others believing it should be driven by research provided by publisher
