an incredible season for algebraic geometry flourished in Italy between 1860 when Luigi Cremona was assigned the chair of Geometria Superiore in Bologna and 1959 when Francesco Severi published the last volume of the treatise on algebraic systems over a surface and an algebraic variety. This century long season has had a prominent influence on the evolution of complex algebraic geometry both at the national and international levels and still inspires modern research in the area. Algebraic geometry in Italy between tradition and future is a collection of contributions aiming at presenting some of these powerful ideas and their connection to contemporary and if possible future developments such as Cremonian transformations, birational classification of high dimensional varieties starting from Gino Fano, the life and works of Guido Castelnuovo, Francesco Severi's mathematical library etc. The presentation is enriched by the viewpoint of various researchers of the history of mathematics who describe the cultural milieu and tell about the bios of some of the most famous mathematicians of those times.

This reference presents the proceedings of an international meeting on the occasion of the University of Bologna's ninth centennial highlighting the latest developments in the field of geometry and complex variables and new results in the areas of algebraic geometry, differential geometry and analytic functions of one or several complex variables building upon the rich tradition of the University of Bologna's great mathematics teachers. This volume contains new studies on the history of mathematics including the algebraic geometry work of F. Enriques, B. Levi and B. Segre, complex function theory, ideas of I. Fantappiè, B. Levi's pincherle and G. Vitali, series theory and logarithm theory, contributions of P. Mengoli and S. Pincherle and much more. Additionally, the book lists all the University of Bologna's mathematics professors from 1860 to 1940 with precise indications of each course year by year including survey papers on combinatorics, complex analysis and complex algebraic geometry inspired by Bologna's mathematicians.

this book offers a wide ranging introduction to algebraic geometry along classical lines it consists of lectures on topics in classical algebraic geometry including the basic properties of projective algebraic varieties linear systems of hypersurfaces algebraic curves with special emphasis on rational curves linear series on algebraic curves cremona transformations rational surfaces and notable examples of special varieties like the segre grassmann and veronese varieties an integral part and special feature of the presentation is the inclusion of many exercises not easy to find in the literature and almost all with complete solutions the text is aimed at students in the last two years of an undergraduate program in mathematics it contains some rather advanced topics suitable for specialized courses at the advanced undergraduate or beginning graduate level as well as interesting topics for a senior thesis the prerequisites have been deliberately limited to basic elements of projective geometry and abstract algebra thus for example some knowledge of the geometry of subspaces and properties of fields is assumed the book will be welcomed by teachers and students of algebraic geometry who are seeking a clear and panoramic path leading from the basic facts about linear subspaces conics and quadrics to a systematic discussion of classical algebraic varieties and the tools needed to study them the text provides a solid foundation for approaching more advanced and abstract literature
