7 if so the individual members of each class thus identified could then be subjected to a more profound pharmacokinetic analysis in other words we had to determine first which hormone protects against which drug before we could explore how it did this we had to know first that a hormone has adaptive value before we could ask whether this is due to a syntoxic or a catatoxic mechanism such observations as the fact that an indomethacin induced intestinal ulcer can be prevented by ethylestrenol orthat cortisol aggravates certain infections reveal nothing

about how these hormones work but only findings of this type can tell us where further research would be rewarding of course scientists can rarely identify by direct observation the things that they are looking for most of the time they have to be guided by indirect indices the ebernist often first detects a compound or even a particular functional group in its molecule by inference from a color reaction a revealing x ray diffraction pattern or the formation of a characteristic precipitate the physician must first suspect the presence of a microbe through certain clinical signs and symptoms before he can verify his diagnosis by looking for a particular organism it is perhaps not too daring to hope that in our first efforts to clarify the role of hormones in resistance simple directly visible indicators might also serve us best
