annotation the nature of immigrant entrepreneurship is changing in dutch society nowadays many immigrant entrepreneurs start
 businesses in producer and personal services instead of more traditional sectors such as retail or hotel and catering at the same
 time a growing number of second generation immigrants are setting up their own firms in the netherlands these second generation
 immigrants born and or raised in the receiving country are following different trajectories in comparison with first generation
 immigrant entrepreneurs indeed displaying a move away from traditional immigrant niches yet studies on second generation
 immigrant entrepreneurs remain limited in both the dutch and international literature on this subject this study presents one of the
 first explicit comparisons between first and second generation self employed immigrants the embeddedness of immigrants in local
 and transnational networks and the dynamics of the markets in which these entrepreneurs are active are examined based on in
 depth interviews with immigrant entrepreneurs in dutch cities in doing so this study provides a vivid longitudinal view of first and

second generation immigrant entrepreneurs their incorporation into dutch society their businesses and business development s this title can be previewed in google books books google com books vid isbn9789053569726 this title is available in the oapen library oapen org

this book reports the first systematic monitoring and modelling study on water availability water quality and seawater intrusion of the shatt al arab river sar on the border of iraq and iran where causes and concentration levels of salinity have not yet been fully understood let alone addressed leading to conflicting perceptions of its origin external or internal the natural conditions and the practices that can explain the current critical conditions current scientific knowledge on the sar salinity problem is deficient partially due to the complex and dynamic interaction between marine and terrestrial salinity sources including return flows by water users of the different water sectors in the euphrates and tigris rivers upstream of the sar the development of a new series of monitoring stations and various modelling approaches helped to better understand the interactions between these different sources the comprehensive and detailed dataset formed the basis for a validated analytical model that can predict the extent of seawater relative to other salinity sources in an estuary and for a hydrodynamic model that can predict salinity changes the adaptability of the models to changing conditions makes them directly applicable by water managers the procedure can be applied to other comparable systems

precipitation drives the dynamics of flows and storages in water systems making its monitoring essential for water management conventionally precipitation is monitored using in situ and remote sensors in situ sensors are arranged in networks which are usually sparse providing continuous observations for long periods at fixed points in space and due to the high costs of such networks they are often sub optimal to increase the efficiency of the monitoring networks we explore the use of sensors that can relocate as rainfall events develop dynamic sensors as well as increasing the number of sensors involving volunteers citizens this research

focusses on the development of an approach for merging heterogeneous observations in non stationary precipitation fields exploring the interactions between different definitions of optimality for the design of sensor networks as well as development of algorithms for the optimal scheduling of dynamic sensors this study was carried out in three different case studies including bacchiglione river italy don river u k and brue catchment u k the results of this study indicate that optimal use of dynamic sensors may be useful for monitoring precipitation to support water management and flow forecasting
