presenting the first book to focus on the importance of silicon for plant health and soil productivity and on our current understanding of this element as it relates to agriculture long considered by plant physiologists as a non essential element or plant nutrient silicon was the center of attention at the first international

conference on silicon in agriculture held in florida in 1999 ninety scientists growers and producers of silicon fertilizer from 19 countries pondered a paradox in plant biology and crop science they considered the element si second only to oxygen in quantity in soils and absorbed by many plants in amounts roughly equivalent to those of such nutrients as sulfur or magnesium some species including such staples as rice may contain this element in amounts as great as or even greater than any other inorganic constituent compilations of the mineral composition of plants however and much of the plant physiological literature largely ignore this element the participants in silicon in agriculture explored that extraordinary discrepancy between the silicon content of plants and that of the plant research enterprise the participants all of whom are active in agricultural science with an emphasis on crop production presented and were presented with a wealth of evidence that silicon plays a multitude of functions in the real world of plant life many soils in the humid tropics are low in plant available silicon and the same condition holds in warm to hot humid areas elsewhere field experience and experimentation even with nutrient solutions reveals a multitude of functions of silicon in plant life resistance to disease is one toleration of toxic metals such as aluminum another silicon applications often minimize lodging of cereals leaning over or even becoming prostrate and often cause leaves to assume orientations more favorable for light interception for some crops rice and sugarcane in particular spectacular yield responses to silicon application have been obtained more recently other crop species including orchids daisies and yucca were reported to respond to silicon accumulation and plant growth disease control the culture solutions used for the hydroponic production of high priced crops such as cucumbers and roses in many areas the netherlands for example routinely included silicon mainly for disease control the biochemistry of silicon in plant cell walls where most of it is located is coming increasingly under scrutiny the element may act as a crosslinking element between carbohydrate polymers there is an increased conviction among scientists that the time is at hand to stop treating silicon as a plant biological nonentity the element exists and it matters

widely used in adsorption catalysis and ion exchange the family of molecular sieves such as zeolites has been greatly extended and many advances have recently been achieved in the field of molecular sieves synthesis and related porous materials chemistry of zeolites and related porous materials focuses on the synthetic and structural chemistry of the major types of molecular sieves it offers a systematic introduction to and an in depth discussion of microporous mesoporous and macroporous materials and also includes metal organic frameworks provides focused coverage of the key aspects of molecular sieves features two frontier subjects molecular engineering and host guest advanced materials comprehensively covers both theory and application with particular emphasis on industrial uses this book is essential reading for researchers in the chemical and materials industries and research institutions the book is also indispensable for researchers and engineers in r d for catalysis divisions of companies in petroleum refining and the petrochemical and fine chemical industries

subsidence of geologic surface structures due to withdrawal of fluids from aquifers and petroleum reservoirs is a phenomenon experienced throughout the world as the demand for water and hydrocarbons increases with increasing population growth this book addresses the definition and theories of subsidence and the influences of unique conditions on subsidence it includes discussions of specific field cases and a basic mathematical model of reservoir compaction and

accompanying loss of porosity and permeability the book is designed as a reference for readers giving immediate access to the geological events that establish conditions for compaction the mathematical theories of compaction and subsidence and practical considerations of field case histories in various regions of the world

the modeling of minerals and silicated materials is a difficult challenge faced by solid statephysics quantum chemistry and molecular dynamics communities the difficulty of such a modeling is due to the wide diversity of elements including heavy atoms and types of bonding involved in such systems moreover one has to consider infinite systems either perfect crystals or glasses and melts in the solid state a given chemical composition gives rise to numerous polymorphs geometricallycloselyrelated these polymorphs have very similar energies and related thermodynamical properties which explain the complexity of their phase diagrams the modeling of silicates and minerals covers a wide field of applications ranging from basic research to technology from solid state physics to earth and planetary science the use of modeling techniques yields information of different nature in the case of chemical studies we can mention investigations on catalytic processes occurring on surfaces and in zeolite cages these calculations find possible applications in chemical engineering in particular in the oil industry

water management challenges in global change contains the proceedings of the 9th computing and control for the water industry ccwi2007 and the sustainable urban water management suwm2007 conferences the rationale behind these conferences is to improve the management of urban water systems through the development of computerbased methods issues such as economic globalisation climate changes and water shortages call for a new approach to water systems management which addresses the relevant technical social and economic aspects this collection represents the views of academic and industrial experts from a number of countries who provide technical solutions to current water management problems and present a vision for addressing the global questions the themes underlying many of the contributions include energy and material savings water savings and the integration of different aspects of water management the papers are grouped into three themes covering water distribution systems sustainable urban water management and modelling of wastewater treatment plants the water distribution topics cover asset and information management planning monitoring and control hydraulic modelling of steady state and transients water quality and treatment demand and leakage management optimisation design and decision support systems as well as reliability and security of water distribution systems the sustainable urban water management topics include urban drainage systems water reuse social aspects of water management and also selected facets of water resources and irrigation computer control of wastewater treatment plants has been seen as less advanced than that of clean water systems to address this imbalance this book presents a number of modelling techniques developed specifically for these plants water management challenges in global change will prove

to be invaluable to water and environmental engineering researchers and academics managers engineers and planners and postgraduate students

the issues for 1857 1911 include report on the progress of pharmacy the last volume 1911 contains only report on the progress of pharmacy the constitution by laws and roll of members

the purpose of this report is to 1 summarize water quality and biomonitoring studies of coal seam produced waters in alabama and 2 to present a monitoring approach for evaluating the risk and acceptability of surface discharge for certain produced waters the integrated monitoring approach termed the cedar cove model was developed for produced waters derived from the development of methane from coal seams in alabama the integrated monitoring approach consists of chemical specific effluent monitoring toxicological evaluation of the produced water instream bioassessment and continual water quality monitoring of the receiving stream
