the problem of metrization of topological spaces has had an enormous influence on the development of general topology singling out the basic topological components of metrizability has determined the main reference points in the construction of the classification of topological spaces these are primarily paracompactness collectionwise normality monotonic normality and perfect normality the concepts of a stratifiable space moore space and u space point countable base and uniform base the method of covers has taken up a leading role in this classification of paramount significance in the applications of this method have been the properties of covers relating to the character of their elements open covers closed covers the mutual disposition of these elements star finite point finite locally finite covers etc as well as the relations of refinement between covers simple refinement refinement with closure

combinatorial refinement star and strong star refinement on this basis a hierarchy of properties of paracompactness type has been singled out together with the classes of spaces corresponding to them the most important of which is the class of paracompacta the behaviour of families of covers with respect to the topology of a space has important significance here first and foremost is the notion of a refining family of covers a development which appears in several modifications and together with the notion of paracompactness plays a key role in metrization problems

this is the first of the encyclopaedia volumes devoted to general topology it has two parts the first outlines the basic concepts and constructions of general topology including several topics which have not previously been covered in english language texts the second part presents a survey of dimension theory from the very beginnings to the most important recent developments the principal ideas and methods are treated in detail and the main results are provided with sketches of proofs the authors have succeeded admirably in the difficult task of writing a book which will not only be accessible to the general scientist and the undergraduate but will also appeal to the professional mathematician the authors efforts to detail the relationship between more specialized topics and the central themes of topology give the book a broad scholarly appeal which far transcends narrow disciplinary lines

compactness is related to a number of fundamental concepts of mathematics particularly important are compact hausdorff spaces or compacta compactness appeared in mathematics for the first time as one of the main topological properties of an interval a square a sphere and any closed bounded subset of a finite dimensional euclidean space once it was realized that precisely this property was responsible for a series of fundamental facts related to those sets such as boundedness and uniform continuity of continuous functions defined on them compactness was given an abstract definition in the language of general topology reaching far beyond the class of metric spaces this immensely extended the realm of application of this concept including in particular function spaces of quite general nature the fact that general topology provided an adequate language for a description of the concept of compactness and secured a natural medium for its harmonious development is a major credit to this area of mathematics the final formulation of a general definition of compactness and the creation of the foundations of the theory of compact topological spaces are due to p s aleksandrov and urysohn see aleksandrov and urysohn 1971

this volume contains the proceedings of the special session on modern methods in continuum theory presented at the 100th annual joint mathematics meetings held in cincinnati ohio it also features the houston problem book which includes

a recently updated set of 200 problems accumulated over several years at the university of houston these proceedings and problems are aimed at pure and applied mathematicians topologists geometers physicists and graduate level students in these disciplines

the discovery of dopamine in 1957 1958 was one of the seminal events in the development of modern neuroscience and has been extremely important for the development of modern therapies of neurological and psychiatric disorders dopamine has a fundamental role in almost all aspects of behavior from motor control to mood regulation cognition and addiction and reward and dopamine research has been unique within the neurosciences in the way it has bridged basic science and clinical practice over the decades research into the role of dopamine in health and disease has been in the forefront of modern neuroscience the dopamine handbook is the first single volume publication to capture current progress and excitement in this dynamic research field

this book is designed for the reader who wants to get a general view of the terminology of general topology with minimal time and effort the reader whom we assume to have only a rudimentary knowledge of set theory algebra and analysis will be able to find what they want if they will properly use the index however this book contains very few proofs and the reader who wants to study more systematically will find sufficiently many references in the book key features more terms from general topology than any other book ever published short and informative articles authors include the majority of top researchers in the field extensive indexing of terms

a topological embedding is a homeomorphism of one space onto a subspace of another the book analyzes how and when objects like polyhedra or manifolds embed in a given higher dimensional manifold the main problem is to determine when two topological embeddings of the same object are equivalent in the sense of differing only by a homeomorphism of the ambient manifold knot theory is the special case of spheres smoothly embedded in spheres in this book much more general spaces and much more general embeddings are considered a key aspect of the main problem is taming when is a topological embedding of a polyhedron equivalent to a piecewise linear embedding a central theme of the book is the fundamental role played by local homotopy properties of the complement in answering this taming question the book begins with a fresh description of the various classic examples of wild embeddings i e embeddings inequivalent to piecewise linear embeddings engulfing the fundamental tool of the subject is developed next after that the study of embeddings is organized by codimension the difference between the ambient dimension and the dimension of the embedded space in all codimensions greater than two

topological embeddings of compacta are approximated by nicer embeddings nice embeddings of polyhedra are tamed topological embeddings of polyhedra are approximated by piecewise linear embeddings and piecewise linear embeddings are locally unknotted complete details of the codimension three proofs including the requisite piecewise linear tools are provided the treatment of codimension two embeddings includes a self contained elementary exposition of the algebraic invariants needed to construct counterexamples to the approximation and existence of embeddings the treatment of codimension one embeddings includes the locally flat approximation theorem for manifolds as well as the characterization of local flatness in terms of local homotopy properties

geometric topology is a foundational component of modern mathematics involving the study of spacial properties and invariants of familiar objects such as manifolds and complexes this volume which is intended both as an introduction to the subject and as a wide ranging resouce for those already grounded in it consists of 21 expository surveys written by leading experts and covering active areas of current research they provide the reader with an up to date overview of this flourishing branch of mathematics
