major changes have recently taken place in the value attached to components of milk although approximately half the energy in milk is contained in fat fat is rapidly decreasing in value relative to protein this has come about because of the increased availability of competitively priced plant derived edible oils and because of the perceived health problems associated with animal fat in the human diet such changes have major implications for the dairy sector particularly in developed countries against this background this book presents a timely review of developments in milk production and consumption of changes in milk component values and of the opportunities that biotechnology provides to alter the composition of and add value to milk on the farm the subject coverage is very broad ranging from nutritional aspects of pastures and forages to rumen microbiology genetics and reproductive technologies milk biochemistry and environmental implications it is based on a conference held in wellington new zealand in february 1996 and sponsored by the oecd and agresearch contributors include leading research workers from north america europe japan australia and new zealand it provides an invaluable overview of the subject suitable as a reference book for advanced students researchers and advisers in dairy science as well as related disciplines such as grassland nutritional and food sciences

although bioactive compounds in milk and dairy products have been extensively studied during the last few decades especially in human and bovine milks and some dairy products very few publications on this topic are available especially in other dairy species milk and their processed dairy products also little is available in the areas of bioactive and nutraceutical compounds in bovine and human milks while books on other mammalian species are non-existent bioactive components in milk and dairy products extensively covers the bioactive components in milk and dairy products of many dairy species including cows goats buffalo sheep horse camel and other minor species park has assembled a group of internationally reputed scientists in the forefront of functional milk and dairy products food science and technology as contributors to this unique book coverage for each of the various dairy species includes bioactive proteins and peptides bioactive lipid components oligosaccharides growth factors and other minor bioactive compounds such as minerals vitamins hormones and nucleotides etc bioactive components are discussed for manufactured dairy products such as caseins caseinates and cheeses yogurt products koumiss and kefir and whey products aimed at food scientists food technologists dairy manufacturers nutritionists nutraceutical and functional foods specialists allergy specialists biotechnologists medical and health professionals and upper level students and faculty in dairy and food sciences and nutrition bioactive components in milk and dairy products is an important resource for those who are seeking nutritional health and therapeutic values or product technology information on milk and dairy products from the dairy cow and species beyond areas featured are unique coverage of bioactive compounds in milks of the dairy cow and minor species including goat sheep buffalo camel and mare identifies bioactive components and their analytical isolation methods in manufactured dairy products such as caseins caseinates and cheeses yogurt products koumiss and kefir and whey products essential for professionals as well as biotechnology researchers specializing in functional foods nutraceuticals probiotics and prebiotics contributed chapters from a team of world renowned expert scientists

milk and products made from it affect the lives of a large proportion of the world's population many dairy products are consumed at times and in places far removed from the point at which the milk was produced this is made possible by the chemical and physical treatments and fractionations applied to milk by modern technology these treatments are designed to preserve the nutritional value of the milk constituents in the form of palatable products as food technology in general becomes more advanced and more sophisticated there is less need for specific commodity technology on the other hand there is more need for specific knowledge of raw materials and the effects of various processing treatments on them from the preface to dairy chemistry and physics
