wind power capacity in the world has been increased by more than 30 over the last decade in countries which have prominent installations wind energy conversion systems wecss based on the doubly fed induction generator dfig have dominated the wind power generation sector due to the outstanding advantages they provide including small converter ratings around 30% of the generator rating and lower converter costs due to the non linearity of wind power systems the dfig power control setup presents a big challenge especially under conditions of high variance in wind speed and parameter sensing to overcome these major problems an improved idpc indirect power control system based on pid proportional integral derivative controller has been proposed instead of the conventional power inverters this handbook covers information about idpc based wecs the book starts with a general introduction to wind power system basics subsequent chapters provide additional knowledge about robustness tests and adaptive intelligent control systems employed in wind energy systems the new concept of direct and quadrature current control ird iq under mppt maximum power point tracking strategy is also explained along with novel fuzzy logic type control systems the authors have included detailed diagrams and an appendix of wecs parameters making this handbook a useful primer for engineering students working towards completing licenses masters degrees and post graduation programs in advanced wind power energy systems
