the number of mouse models that are available for the study of human genetic neurological disorders is large and growing rapidly therefore it was difficult to select the models that were reviewed in this volume clearly there are important models that are not discussed and perhaps a volume twice this size would have been more appropriate moreover the pace at which new models are being developed and analyzed is rapid as this volume goes to press i am sure that additional mouse genes responsible for naturally occurring neurological disorders are being discovered and that many new transgenic and mutant mouse strains are being developed therefore this volume should not be viewed as a comprehensive compendium but rather as an update of work in progress it is exhilarating to witness the fast pace at which these models are being established as important tools in the study of basic neuroscience and neurological disorders it will be even more exciting to see their utilization in the development and testing of therapeutic interventions for these diseases i would like to thank each of the authors who have contributed to this volume for their time and their expertise i would also like to thank drs timothy coetzee and joshua corbin for their advice in the selection of the topics covered i am deeply indebted to dr kunihiro suzuki who first approached me with the idea for this volume for his guidance throughout its preparation
