numerical simulation of non newtonian flow focuses on the numerical simulation of non newtonian flow using finite difference and finite element techniques topics range from the basic equations governing non newtonian fluid mechanics to flow classification and finite element calculation of flow generalized newtonian flow and viscoelastic flow an overview of finite difference and finite element methods is also presented comprised of 11 chapters this volume begins with an introduction to non newtonian mechanics paying particular attention to the rheometrical properties of non newtonian fluids as well as non newtonian flow in complex geometries the role of non newtonian fluid mechanics is also considered the discussion then turns to the basic equations governing non newtonian fluid mechanics including navier stokes equations and rheological equations of state the next chapter describes a flow classification in which the various flow problems are grouped under five main headings flows dominated by shear viscosity slow flows slightly elastic liquids small deformation flows nearly viscometric flows and long range memory effects in complex flows the remainder of the book is devoted to numerical analysis of non newtonian fluids using finite difference and finite element techniques this monograph will be of interest to students and practitioners of physics and mathematics

every group is represented in many ways as an epimorphic image of a free group it seems therefore futile to search for methods involving generators and relations which can be used to detect the structure of a group nevertheless results in the indicated direction exist the clue is to ask the right question classical geometry is a typical example in which the factorization of a motion into reflections or more generally of a collineation into central collineations supplies valuable information on the geometric and algebraic structure this mode of investigation has gained momentum since the end of last century the tradition of geometric algebraic interplay brought forward two branches of research which are documented in parts i and ii of these proceedings part ii deals with the theory of reflection geometry which culminated in bachmann s work where the geometric information is encoded in properties of the group of motions expressed by relations in the generating involutions this approach is the backbone of the classification of motion groups for the classical unitary and orthogonal planes the axioms in this characterization are natural and plausible they provoke the study of consequences of subsets of axioms which also yield natural geometries whose exploration is rewarding bachmann s central axiom is the three reflection theorem showing that the number of reflections needed to express a motion is of great importance
