rock rheology governs the deformation of rocks in reaction to forces within the earth's
 interior rheology is the scientific study of material properties specifically focusing on the
 relationship between stress force per unit area and strain rate rate of deformation with
 the emergence of plate tectonics it has become clear that comprehending the movement
 of plates alone is not enough to properly explain the interaction between earth's
 lithosphere and mantle convection as well as other driving forces this is apparent when
 analyzing the intricate deformation patterns of plate boundary zones which can now be
 accurately traced using space geodetic methods the rheology of rocks is influenced by
 various factors such as mineralogy geofluid composition and content grain size of
 minerals amount of melt present temperature pressure and the circumstances of
 differential stress the variation in mineralogical and chemical composition of rocks is vast
 and our understanding of crucial factors such regional heat movement and tectonic
 pressures is expanding over time the convective pattern in the upper mantle under the
 tectonic plates is not directly linked to the plate boundaries instead it could be identified
 and studied by analyzing geophysical parameters like topography gravity's wave
 dispersion heat flux etc nevertheless earthquakes are now the sole means of directly
 observing motions occurring below the earth's surface at depths exceeding a few
 kilometers the correlation between the depths at which these earthquakes occur and the
 speeds at which subduction takes place indicates that the occurrence of seismic activity is
 influenced by various parameters like temperature in this research topic we seek to
 comprehend the factors that differentiate the seismic movement of certain faults from
 the creeping movement of others what are the first causes of faults and how do they
 progress into plate boundaries the mapping of geofluids has allowed for the identification
 of areas that have experienced significant tectonic activity essentially places with active
 tectonic activity and geofluids will continue to experience earthquakes until major
 global geodynamic events change the current state of tectonic activity this research topic
 attempts to present the most advanced studies on the mechanisms of earthquakes using
 geophysical geochemical geodetic and statistical methods the focus is on understanding

the entire process from the initial nucleation to the occurrence of the earthquake recent meetings held by the asia oceania geosciences society the european geosciences union the american geophysical union etc underlined the crucial importance of observatory networks of monitoring systems from space ground and subsurface based on multiple kind of sensors of potential anomalies related to the inter seismic pre seismic co post seismic processes and their spatial and temporal scales of advances in numerical modelling of the physical processes of nucleation dynamic rupturing and seismic wave propagating of earthquakes based on coupling of multiple disciplinary observation data and of possible further researches related to the occurrence of great earthquakes and of induced seismicity
