the nervous system is the product of biological evolution and is shaped by the interplay between extrinsic factors determining the ecology of animals and by intrinsic processes that dictate the developmental rules that give rise to adult functional structures this special topic is oriented to develop an integrative view from behavior and ecology to neurodevelopmental processes we address questions such as how do sensory systems evolve according to ecological conditions how do neural networks organize to generate adaptive behavior how does cognition and brain connectivity evolve what are the developmental mechanisms that give rise to functional adaptation accordingly the book is divided in three sections i evolution of sensorimotor systems ii cognitive computations and neural circuits and iii development and brain evolution we hope that this initiative will support an interdisciplinary program that addresses the nervous system as a unified organ subject to both functional and developmental constraints where the final outcome results of a compromise between different parameters rather than being the result of several single variables acting independently of each other

when santiago ramón y cajal started to unravel the fine structure of the nervous system in the last decades of the nineteenth century maybe only his unbeatable soul of brave spaniard imagined that most of the descriptions were scientific truths that lasted to date simple histological stainings curiosity to ameliorate these monocular microscopes patience for drawing his observations and a rich imaginative open mind this is the recipe for cajal success his descriptions of connectivity in the nervous system compiled in cajal's opus magna published in 1904 *textura del sistema nervioso del hombre y los vertebrados* and 1911 *histologie du systeme nerveux* have been corroborated by modern techniques decade after decade even more the main hypothesis that cajal raised are universally recognised as biological laws today the neuron theory the law on the dynamic polarization of the neuron and the chemotropic hypothesis that is the nervous system is not a syncytial network but is formed by individual cells the transmission of the nerve impulses follow a main direction within a given neuron the axons are guided by chemical substances in a chemotropic way till form synapses with their targets attracted by cajal's strong personality and scientific success a number of medical students and doctors join him in the crusade to explore the nervous system and the seed planted by the universal savant was really successful francisco tello described interesting aspects of the regeneration of peripheral nerves which are very useful for neuroscientist currently working in this topic nicolás achúcarro significantly contributed to study neuroglia and

future microglia pío del río hortega identified two out of the four main nervous cell types the oligodendrocytes and microglia and proposed an almost still valid classification for the cns tumours fernando de castro made was the first description of arterial chemoreceptors in the carotid body rafael lorente de nó was a dominant figure of neuroscience for decades after the iind world war first describing the columnar organization of the cerebral cortex well before mountcastle hubbel and wiesel even less recognised co workers and disciples of cajal his brother pedro ramón y cajal domingo sánchez the neurologist rodríguez lafora protagonised discoveries that are consolidated scientific truths today altogether it is difficult if not impossible to find a school in biology contributing in such a fundamental and variated way to the common acervo like the collectively known as cajal school or spanish neurological school although the particular way to work of the maestro selecting a pleiade of brilliant collaborators with whom accomplish such a titanic feat giving them freedom for their studies has been recognised and confronted to antagonic systems followed by other relevant scientists and scientific schools the general recognition of such a significant major milestones for neuroscience and their vigency in the well marched xxist century is not this is the purpose of this ebook to remind all these examples of how successful can be the scientific work when it is minutious constant and performed by brilliant imaginative and skilled scientists with a minimal conditions supporting their efforts

sensory systems play important roles in inducing a variety of responses that are critical to the survival of individuals and species neural circuits are generated by a combination of activity dependent and independent processes the basic architecture of sensory systems is built before birth based on a genetic program however the neural maps and circuits are further refined after birth in an activity dependent manner if the system is left unstimulated in neonates its function is permanently impaired and cannot be recovered even when it is stimulated after the critical period

neuroanatomists increasingly rely on techniques enabling them to manipulate genes in defined brain cell populations in particular engineered transgenes which encode a variety of fluorescent reporter proteins can be inserted into the genome or delivered into desired brain regions using viral vectors thereby allowing the labeling of molecularly defined populations of neurons and or glial cells transgenic technology can also be used to selectively delete genes in targeted neuronal populations or bi directionally modulate their electrical excitability using optogenetic or chemogenetic techniques one of the primary advantages of using transgenic reagents is to simplify the identification and tracing of targeted population of brain cells which can be laborious using

traditional techniques in neuroanatomy in this research topic we assembled up to date reviews and original articles that demonstrate the versatility and power of transgenic tools in advancing our knowledge of the nervous system with a special emphasis on the application of transgenic technology to neuroanatomical questions

photons are sensed by retinal photoreceptors whose matrix like distribution underlies the transformation of illumination patterns of the visual scene into photoreceptor activity patterns in a visuotopic fashion activity of neighboring photoreceptors then are compared by secondary bipolar cells to decipher information regarding luminosity and color contrast bipolar cells achieve this by comparing signals received directly from their center receptive field with those come from spatially offset surrounding receptive field areas mediated by inhibitory sign inverting horizontal cells this information is ultimately sent to retinal ganglion cells the output neurons of the retina in addition to the excitatory bipolar cell inputs spatial and temporal features of ganglion cell activation are robustly modified by inner retinal amacrine cells through inhibitory chemical and or excitatory electrical synaptic inputs ganglion cells sample various bipolar cell subtypes in their dendritic field and utilize collected inputs to generate a spike output code on luminosity contrast color contrast object motion background motion motion direction changes in background illumination in a subtype specific manner ganglion cells in each subtype cover the retinal surface economically thus collective information across the population provide a feature pattern and through time a feature movie to the brain some of these movies are utilized for image perception whereas others are sent to accessory visual brain centers to control eye movement pupil contraction or circadian entrainment a large body of information has been revealed in the past decade regarding this field however much of the details still remain unknown or even enigmatic including i the precise description of neural circuits that serve each ganglion cell subtype to generate a specific feature movie ii the estimation of the number of various ganglion cell subtypes that partake in image forming and non image forming signaling towards the brain iii the description of changes in the inputs morphology and signaling of retinal ganglion cells when the tissue is under stress or undergoes disease related degenerative processes iv the comparison of ganglion cell classes with those of the human retina and finally v the practical use of all the above information to establish retina inspired visual algorithms to suit computer drone and or robotic vision therefore research articles in this issue were collected to touch upon each of these topics and highlight recent advances of the related field

it is in general well appreciated that the cortical interneurons play various important roles in cortical neuronal

networks both in normal and pathological states based on connectivity pattern developmental morphological and electrophysiological properties distinct subgroups of gabaergic interneurons can be differentiated in the neocortex as well as in the hippocampal formation in this e book we are focusing our attention on inhibitory interneurons expressing calcium binding protein calretinin cr the aim of the e book is to consolidate the knowledge about this interneuronal population and to inspire further research on the function and malfunction of these neurons which functionally seem to stand at the top of the pyramid of cortical interneuronal types
