the purpose of this book is to introduce a new notion of analytic space over a
non archimedean field despite the total disconnectedness of the ground field
these analytic spaces have the usual topological properties of a complex
analytic space such as local compactness and local arcwise connectedness
this makes it possible to apply the usual notions of homotopy and singular
homology the book includes a homotopic characterization of the analytic
spaces associated with certain classes of algebraic varieties and an
interpretation of bruhat tits buildings in terms of these analytic spaces the
author also studies the connection with the earlier notion of a rigid analytic
space geometrical considerations are used to obtain some applications and
the analytic spaces are used to construct the foundations of a non

archimedean spectral theory of bounded linear operators this book requires a background at the level of basic graduate courses in algebra and topology as well as some familiarity with algebraic geometry it would be of interest to research mathematicians and graduate students working in algebraic geometry number theory and adic analysis

analytic and algebraic geometers often study the same geometric structures but bring different methods to bear on them while this dual approach has been spectacularly successful at solving problems the language differences between algebra and analysis also represent a difficulty for students and researchers in geometry particularly complex geometry the pcmi program was designed to partially address this language gulf by presenting some of the active developments in algebraic and analytic geometry in a form suitable for students on the other side of the analysis algebra language divide one focal point of the summer school was multiplier ideals a subject of wide current interest in both subjects the present volume is based on a series of lectures at the pcmi summer school on analytic and algebraic geometry the series is designed to give a high level introduction to the advanced techniques behind some recent developments in algebraic and analytic geometry the lectures contain many illustrative examples detailed computations and new perspectives on the topics presented in order to enhance access of this material to non specialists publisher s description

this book talks about the traditional subjects of euclidean relative and projective geometry in two and three measurements including the order of conics and quadrics and geometric changes these subjects are imperative both for the scientific establishing of the understudy and for applications to different subjects they might be contemplated in the principal year or as a moment course in geometry the material is exhibited geometrically and it means to build up the geometric instinct and thinking about the understudy and in addition his capacity to comprehend and give numerical evidences direct polynomial math isn t an essential and is kept to an absolute minimum the book incorporates a couple of methodological curiosities and a substantial number of activities and issues with arrangements particularly composed as an incorporated study of the improvement of diagnostic geometry this great investigation adopts a one of a kind strategy to the historical backdrop of thoughts
