a technique is presented which finds a fast suboptimal solution to the assignment problem this same technique is then applied to two large dynamic programming problems for which the optimal solution is not known these examples illustrate how easily this technique can be applied and that it is better than most optimizing techniques because it is fast cheap and only minor hand calculations are needed the effect of different initial solutions and their value are compared and it is found that the initial solution is not as significant in a suboptimal technique as in an optimizing technique the initial solution is

significant enough however to warrant some care in choosing it abstract leaf ii

emerging trends in industrial engineering and management iem refer to the new and transformative developments practices and technologies that are currently gaining prominence in the field of industrial engineering and management trends in industrial engineering and management can encompasses a wide range of topics such as utilization of industry 4 0 strategies like industrial internet of things artificial intelligence theoretical numerical computational approaches to model the methods and process of iem this book provides a comprehensive discussion of industrial engineering and management includes principles of continuous improvement encouraging readers to adopt a mind set of on going optimization and innovation in industrial engineering and management presents multi objective optimization stochastic optimization and metaheuristic optimization algorithms for solving complex optimization problems in industrial engineering aligns with the needs of various industries addressing specific challenges faced by manufacturing healthcare logistics service and other sectors highlights the importance of using digital technological tools like the internet of things industrial internet of things big data and artificial intelligence in practices of industrial management to enhance competitiveness decision making and operations efficiency it is primarily written for senior undergraduates graduate students and academic researchers in the fields of industrial engineering production engineering mechanical engineering operation management industrial management quality engineering and engineering management

a number of algorithms exist to solve or provide a near optimal solution to the multidimensional assignment problem despite the fact that the multidimensional assignment problem has existed for almost fifty years quickly finding a good quality near optimal solution to the multidimensional assignment problem is still difficult solving large multidimensional assignment problems is difficult due to the total number of feasible solutions to be evaluated the total number of feasible solutions for a $5 \times 5 \times 5 \times 5 \times 5$ multidimensional assignment problem is 207 360 000 the number of feasible solutions grows exponentially as the number of dimensions increases solving smaller multidimensional assignment problems by complete enumeration of all feasible solutions is possible but for larger multidimensional assignment problems with size and dimension equal to or greater than six the time required for complete enumeration often exceeds the time available to compute a solution consequently many multidimensional assignment problem heuristic and metaheuristic algorithms have been developed in order to determine a good quality solution to the multidimensional assignment problem in a minimum or reasonable amount

of time some of these algorithms utilize a neighborhood search in order to improve the quality of the starting solution searching a large neighborhood is desirable because a better solution is more likely from searching a larger neighborhood but searching a large neighborhood also requires additional time an improvement graph has been used to solve partitioning problems but has not been utilized to solve a multidimensional assignment problem this work offers a new methodology to solve the multidimensional assignment problem that uses an improvement graph by creating disjoint subsets of the multidimensional assignment problem data using interpermutation exchanges and an improvement graph and creating cyclic transfers it is possible to quickly find a near optimal solution to a multidimensional assignment problem
