oxygen is one of the most essential needs for life on earth and respiration is how living things use it but there's a lot more going on in this seemingly simple process than you might think the respiratory system is in some ways the most underappreciated of the body systems since it works 24/7 mostly without being noticed and never gets a single moment's rest in this book readers discover the most fascinating facts about respiration the structure of the lungs and even some of the seemingly gross processes that happen in their body

this book elucidates the morphological backgrounds of various functional parameters of the human respiratory system including the respiratory control system dynamics of the upper and lower airways gas transport and mixing in the lower airways gas exchange in the acinus and gas transfer through the alveolar wall presenting the latest findings on the interrelationships between morphology and physiology in the respiratory system the book's goal is to provide a foundation for further exploring structure function relationships in various respiratory systems and to improve both the quality of basic science and that of clinical medicine targeting the human respiratory system edited and written by internationally recognized experts structure function relationships in various respiratory systems offers a valuable asset for all physicians and researchers engaging in clinical physiological or morphological work in the field of respiration moreover it provides a practical guide for physicians helping them make more precise pathophysiological decisions concerning patients with various types of lung disease and will be of interest to respiratory physiologists and respiratory morphologists

this is an integrated textbook on the respiratory system covering the anatomy physiology and biochemistry of the system all presented in a clinically relevant context appropriate for the first two years of the medical student course one of the seven volumes in the systems of the body series concise text covers the core anatomy physiology and biochemistry in an integrated manner as required by system and problem based medical courses the basic science is presented in the clinical context in a way appropriate for the early part of the medical course there is a linked website providing self assessment material ideal for examination preparation

the human respiratory system combines emerging ideas from biology and mathematics to show the reader how to produce models for the development of biomedical engineering applications associated with the lungs and airways mathematically mature but in its infancy as far as engineering uses are concerned fractional calculus is the basis of the methods chosen for system analysis and modelling this reflects two decades worth of conceptual development which is now suitable for bringing to bear in biomedical engineering the text reveals the latest trends in modelling and identification of human respiratory parameters with a view to developing diagnosis and monitoring technologies of special interest is the notion of fractal structure which is indicative of the large scale biological efficiency of the pulmonary system the related idea of fractal dimension represents the adaptations in fractal structure caused by environmental factors notably including disease these basics are linked to model the dynamical patterns of breathing as a whole the ideas presented in the book are validated using real data generated from healthy subjects and respiratory patients and rest on non invasive measurement methods the human respiratory system will be of interest to applied mathematicians studying the modelling of biological systems to clinicians with interests outside the traditional borders of medicine and to engineers working with technologies of either direct medical significance or for mitigating changes in the respiratory system caused by for example high altitude or deep sea environments
