algebra as we know it today consists of many different ideas concepts and results a reasonable estimate of the number of these different items would be somewhere between 50 000 and 200 000 many of these have been named and many more could and perhaps should have a name or a convenient designation even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information if this happens one should be able to find enough information in this handbook to judge if it is worthwhile to pursue the quest in addition to the primary information given in the handbook there are references to relevant articles books or lecture notes to help the reader an excellent index has

been included which is extensive and not limited to definitions theorems etc the handbook of algebra will publish articles as they are received and thus the reader will find in this third volume articles from twelve different sections the advantages of this scheme are two fold accepted articles will be published quickly and the outline of the handbook can be allowed to evolve as the various volumes are published a particularly important function of the handbook is to provide professional mathematicians working in an area other than their own with sufficient information on the topic in question if and when it is needed thorough and practical source of information provides in depth coverage of new topics in algebra includes references to relevant articles books and lecture notes

the second volume which assumes familiarity with the material in the first introduces important classes of categories that have played a fundamental role in the subject s development and applications in addition after several chapters discussing specific categories the book develops all the major concepts concerning benabou s ideas of fibered categories

this is a unique type of book at least i have never encountered a book of this kind the best description of it i can give is that it is a mystery novel developing on three levels and imbued with both educational and philosophical moral issues if this summary description does not help understanding the particular character and allure of the book possibly a more detailed explanation will be found useful one of the primary goals of the author is to interest readers in particular young mathematiciansorpossiblypre mathematicians inthefascinatingworldofelegant and easily understandable problems for which no particular mathematical kno edge is necessary but which are very far from being easily solved in fact the prototype of such problems is the following if each point of the plane is to be given a color how many colors do we need if every two points at unit distance are to receive distinct colors more than half a century ago it was established that the least number of colorsneeded for such a coloring is either 4 or 5 or 6 or 7 well which is it despite efforts by a legion of very bright people many of whom developed whole branches of mathematics and solved problems that seemed much harder not a single advance towards the answer has been made this mystery and scores of other similarly simple questions form one level of mysteries explored in doing this the author presents a whole lot of attractive results in an engaging way and with increasing level of depth

since the early seventies concepts of specification have become central in the whole area of computer science especially algebraic specification techniques for abstract data types and software systems have gained considerable importance in recent years they have not only played a central role in the theory of data type specification but meanwhile have had a remarkable influence on programming language design system architectures arid software tools and environments the fundamentals of algebraic specification lay a basis for teaching research and development in all those fields of computer science

where algebraic techniques are the subject or are used with advantage on a conceptual level such a basis however we do not regard to be a synopsis of all the different approaches and achievements but rather a consistently developed theory such a theory should mainly emphasize elaboration of basic concepts from one point of view and in a rigorous way reach the state of the art in the field we understand fundamentals in this context as 1 fundamentals in the sense of a carefully motivated introduction to algebraic specification which is understandable for computer scientists and mathematicians 2 fundamentals in the sense of mathematical theories which are the basis for precise definitions constructions results and correctness proofs 3 fundamentals in the sense of concepts from computer science which are introduced on a conceptual level and formalized in mathematical terms

the second volume of the authors computational commutative algebra covers on its 586 pages a wealth of interesting material with several unexpected applications an encyclopedia on computational commutative algebra a source for lectures on the subject as well as an inspiration for seminars the text is recommended for all those who want to learn and enjoy an algebraic tool that becomes more and more relevant to different fields of applications zentralblatt math

recursive algebra analysis and combinatorics

this volume presents the proceedings from a conference held at the national taiwan university the conference brought together specialists in mathematical physics algebraic geometry differential geometry algebra and number theory from five pacific rim countries included are articles by s t yau v kac m p murthy shing tung yau and other leading specialists

this is the first of a three volume collection devoted to the geometry topology and curvature of 2 dimensional spaces the collection provides a guided tour through a wide range of topics by one of the twentieth century s masters of geometric topology the books are accessible to college and graduate students and provide perspective and insight to mathematicians at all levels who are interested in geometry and topology the first volume begins with length measurement as dominated by the pythagorean theorem three proofs with application to number theory areas measured by slicing and scaling where archimedes uses the physical weights and balances to calculate spherical volume and is led to the invention of calculus areas by cut and paste leading to the bolyai gerwien theorem on squaring polygons areas by counting leading to the theory of continued fractions the efficient rational approximation of real numbers and minkowski s theorem on convex bodies straight edge and compass constructions giving complete proofs including the transcendence of and of the impossibility of squaring the circle duplicating the cube and trisecting the angle and finally to a construction of the hausdorff banach tarski paradox that shows some spherical sets are too complicated and cloudy to

admit a well defined notion of area
