the soliton represents one of the most important of nonlinear phenomena in modern physics it constitutes an essentially localized entity with a set of remarkable properties solitons are found in various areas of physics from gravitation and field theory plasma physics and nonlinear optics to solid state physics and hydrodynamics nonlinear equations which describe soliton phenomena are ubiquitous solitons and the equations which commonly describe them are also of great mathematical interest thus the discovery in 1967 and subsequent development of the inverse scattering transform method that provides the mathematical structure underlying soliton theory constitutes one of the most important developments in modern theoretical physics the inverse scattering transform method is now established as a very powerful tool in the investigation of nonlinear partial differential equations the inverse scattering transform method since its discovery some two decades ago has been applied to a great variety of nonlinear equations which arise in diverse fields of physics these include ordinary differential equations partial differential equations integrodifferential and differential difference equations the inverse scattering transform method has allowed the investigation of these equations in a manner comparable to that of the fourier method for linear equations

the purpose of this book is to provide an invitation to the beautiful and important subject of ergodic theorems both classical and modern which lies at the intersection of many fundamental mathematical disciplines dynamical systems probability theory topology algebra number theory analysis and functional analysis the book is suitable for undergraduate and graduate students as well as non specialists with basic knowledge of functional analysis topology and measure theory starting from classical ergodic theorems due to von neumann and birkhoff the state of the art of modern ergodic theorems such as subsequential multiple and weighted ergodic theorems are presented in particular two deep connections between ergodic theorems and number theory are discussed furstenberg's famous proof of szemerédi's theorem on existence of arithmetic progressions in large sets of integers and the sarnak conjecture on the random behavior of the m -bius function an extensive list of references to other literature for readers wishing to deepen their knowledge is provided

maybe for the first time in the existing literature we investigate here the almost periodic type solutions to the abstract volterra difference equations depending on several variables we also investigate the generalized almost periodic type sequences and their applications in a rather detailed manner as well as many new important spaces of metrically generalized almost periodic type spaces of sequences and functions we essentially apply some results from the theory of c regularized solution operator families to the abstract volterra integro differential difference equations contributing also to the theory of fractional calculus and fractional differential equations the theory of abstract volterra integro differential equations and the theory of abstract volterra difference equations are very attractive fields of research of many authors the almost periodic features and the asymptotically almost periodic features of solutions to the abstract volterra differential difference equations in banach spaces have been sought in many research articles published by now the main aim of this monograph is to continue the work collected in my monographs published with w de gruyter recently by providing several new results about the existence and uniqueness of almost periodic type solutions to the abstract volterra integro differential difference equations which could be solvable or unsolvable with respect to the highest derivative order we would like to particularly emphasize that this is probably the first research monograph devoted to the study of almost periodic type solutions to the abstract volterra difference equations depending on several variables we also consider here many new important spaces of metrically generalized almost periodic type spaces of sequences and functions and their almost automorphic analogues it is also worth noting that this is probably the first research monograph which concerns the generalized almost periodic type sequences and their applications in a rather detailed manner for the first time in the existing literature we also present here some applications of results from the theory of c regularized solution operator families to the abstract volterra difference equations fractional calculus and discrete fractional calculus are rapidly growing fields of theoretical and applied mathematics which are incredibly important in modeling of various real phenomena appearing in different fields like aerodynamics rheology interval valued systems chaotic systems with short memory and image encryption and discrete time recurrent neural networks many important research results regarding the abstract fractional differential equations and the abstract fractional difference equations in banach spaces have recently been obtained by a great number of authors from the whole world in this monograph we also contribute to the theories of discrete fractional calculus fractional differential difference equations and multi dimensional laplace transform although the monograph is far from being complete we have decided to quote almost eight hundred and fifty research articles which could be of some importance to the interested readers for further developments of the theory established here
