neuropsychological assessment is a difficult and complicated process often experienced clinicians as well as trainees and students gloss over fundamental problems or fail to consider potential sources of error since formal test data on the

surface appear unambiguous and objective they may fall into the habit of overemphasizing tests and their scores and underemphasizing all the factors that affect the validity reliability and interpretability of test data but interpretation is far from straightforward and a pragmatic application of assessment results requires attention to a multitude of issues this long awaited updated and greatly expanded second edition of the clinician s guide to neuropsychological assessment like the first focuses on the clinical practice of neuropsychology orienting readers to the entire multitude of issues it guides them step by step through evaluation and helps them avoid common misconceptions mistakes and methodological pitfalls it is divided into three sections fundamental elements of the assessment process special issues settings and populations and new approaches and methodologies the authors all of whom are actively engaged in the clinical practice of neuropsychological assessment as well as in teaching and research do an outstanding job of integrating the academic and the practical the clinician s guide to neuropsychological assessment second edition will be welcomed as a text for graduate courses but also as an invaluable hands on handbook for interns postdoctoral fellows and experienced neuropsychologists alike no other book offers its combination of breadth across batteries and approaches depth and practicality

the growth of clinical neuropsychology has been unprecedented this growth has been oriented more toward the provision of than toward the foundation for services thus while a greater number of psychologists are performing a greater number of neuropsychological procedures there seems to us an uneven parallel growth between these services and the empirical foundations for them it should come to no one s surprise that increasingly aggressive attacks on the field have been leveled despite these attacks clinical neuropsychology con tinues to enjoy exceptional growth within psychology and acceptance by other health practitioners insurance companies legislators judges juries and above all consumers of our services growth without self reflection is a dangerous enterprise as is growth without directions we find it disconcerting that existing and limited self analysis has assumed that neuropsychological dysfunction is immune to the same variables that affect psychological dysfunction some attention has been paid to the most obvious ones such as age but all others

have been ignored and or misunderstood this neglect has spawned a body of knowledge replete with questionable data and unfounded conclusions hence it is surprising that clinical neuropsychologists consider themselves to be more scientifically sound than their regular clinical counterparts

for a period of some fifteen years following completion of my internship training in clinical psychology 1950 1951 at the washington university school of medicine and my concurrent successful navigation through that school's neuroanatomy course clinical work in neuropsychology for me and the psychologists of my generation consisted almost exclusively of trying to help our physician colleagues differentiate patients with neurologic from those with psychiatric disorders in time experience led all of us from the several disciplines involved in this enterprise to the conclusion that the crude diagnostic techniques available to us circa 1945 1965 had garnered us little valid information upon which to base such complex differential diagnostic decisions it now is gratifying to look back and review the remarkable progress that has occurred in the field of clinical neuropsychology in the four decades since i was a graduate student in the late 1940s such pioneers as ward halstead alexander luria george yaczynski hans lukas teuber and arthur benton already were involved in clinical studies that by the late 1960s would markedly have improved the quality of clinical practice however the only psychological tests that the clinical psychologist of my immediate post second world war generation had as aids for the diagnosis of neurologically based conditions involving cognitive deficit were such old standbys as the wechsler bellevue rorschach draw a person bender gestalt and graham kendall memory for designs test

this text offers clinicians and students an introduction to cognitively based assessment methods each chapter is richly illustrated with case examples and includes an overview a summary of empirical findings relevant to clinical assessment and a detailed description of a technique
