## 2 Building Your ProCAST Model

ProCAST uses geometric data to create a digital representation of your casting. This typically involves importing CAD models, defining material properties and specifying process parameters eg pouring temperature, mold material. The brochure usually includes examples and tutorials to guide you through this process. Imagine a screenshot of the ProCAST interface here showing the model creation process.

## 3 Running the Simulation and Analyzing Results

Once the model is built, you initiate the simulation. ProCAST will then calculate the flow of molten metal, solidification patterns, temperature distribution and stress development. The results are typically visualized through various plots, graphs and 3D animations, making it easy to identify potential problem areas. The brochure highlights these visualization capabilities.

## 4 Iterative Design Optimization

Based on the simulation results, you can modify design parameters, process settings or material choices. ProCAST facilitates a quick iterative process, allowing you to refine your design and process until you achieve optimal results.

### Example Scenario: Optimizing a DieCasting Process

3. Let's say you're producing aluminum diecast engine blocks. Using ProCAST, you can simulate different gating systems, analyze potential for air entrapment and predict the risk of hot tearing. By adjusting the gating design and pouring parameters based on the simulation results, you can significantly reduce scrap rates and improve the quality of your castings. Imagine a visual here: A comparative diagram showing two different gating systems and their simulated results, highlighting the improved design.
