designing engineers describes the evolution of three disparate projects an x ray inspection system for airports a photoprint machine and a residential photovoltaic energy system the products of engineering design are everywhere but who or what determines their form and function their surfaces are usually cold seemingly objective as if they existed outside of history of the technologies that are so much a part of our lives written by a practicing engineer designing engineers yields clues to this mystery by probing deeply into the everyday world of engineering in doing so it reveals significant discrepancies between our ideal image of design as an instrumental process and the reality of design as a historically situated social process that is full of uncertainty and ambiguity designing engineers describes the evolution of three disparate projects an x ray inspection system for airports a photoprint machine and a residential photovoltaic energy system in each case we are taken through the hallways and into the meeting rooms of the company to watch over the shoulders of engineers as they engage in the manifold individual and collective work that goes into designing a new product louis bucciarelli was a consultant to one project and participated in the design process for the other two in all three projects he examines both object the way participants understood how things work and process the way they go about designing what he learns is that engineering design is a social process that involves constant negotiation among many parties not just engineers but marketing people research scientists accountants and customers as well one of the strengths of the book is the way bucciarelli uses the very language of engineering discourse to uncover the many levels at which negotiation takes place designing it turns out is as much about agreeing on definitions as it is about producing hard artifacts

introduction to engineering design is a completely novel text covering the basic elements of engineering design for structural integrity some of the most important concepts

that students must grasp are those relating to design thinking and reasoning and not just those that relate to simple theoretical and analytical approaches this is what will enable them to get to grips with practical design problems and the starting point is thinking about problems in a deconstructionist sense by analysing design problems as sophisticated systems made up of simpler constituents and evolving a solution from known experience of such building blocks it is possible to develop an approach that will enable the student to tackle even completely alien design scenarios with confidence the other essential aspect of the design process the concept of failure and its avoidance is also examined in detail and the importance not only of contemplating expected failure conditions at the design stage but also checking those conditions as they apply to the completed design is stressed these facets in combination offer a systematic method of considering the design process and one that will undoubtedly find favour with many students teaching staff and practising engineers alike
