this book is an introduction to the geometry of complex algebraic varieties it is intended for students who have learned algebra analysis and topology as taught in standard undergraduate courses so it is a suitable text for a beginning graduate course or an advanced undergraduate course the book begins with a study of plane algebraic curves then introduces affine and projective varieties going on to dimension and constructibility \mathcal{O} modules quasicoherent sheaves are defined without reference to sheaf theory and their cohomology is defined axiomatically the riemann roch theorem for curves is proved using projection to the projective line some of the points that aren't always treated in beginning courses are hensel's lemma chevalley's finiteness theorem and the birkhoff grothendieck theorem the book contains extensive discussions of finite group actions lines in \mathbb{P}^3 and double planes and it ends with applications of the riemann roch theorem
