sex is the queen of problems in evolutionary biology generations of researchers have investigated one of the last remaining evolutionary paradoxes why sex exists at all given that sexual reproduction is costly from an evolutionary point of view one could wonder why not all animals and plants reproduce asexually dozens of contemporary hypotheses attempt to explain the prevalence of sex and its advantages and predict the early extinction of fully asexual lineages the major theme of this book is what is the fate of animal and plant groups in which sex is lost initial chapters discuss theory behind asexual life what major disadvantages do asexual groups have to face what are the genetic and ecological consequences and what does this theory predict for more applied aspects of asexual life for example in agricultural pests diseases as well as in cultural crops such as grapes cases studies in many animals focusing on both invertebrates and vertebrates and plants reveal parallel but also singularly novel adaptations to the absence of meiosis and syngamy and last but not least are asexuals really doomed to early extinction or do genuine ancient asexuals exist this book assembles contributions from the most important research groups dealing with asexual evolution in eukaryotes it is a milestone in research on parthenogenesis and will be useful to undergraduate as well as graduate students and to senior researchers in all fields of evolutionary biology as the paradox of sex remains its queen of problems

one marker of the majesty of ancient rome is its surviving architectural legacy the stunning remains of which are scattered throughout the circum mediterranean landscape surprisingly one truly remarkable aspect of this heritage remains relatively unknown there exists beneath the waters of the mediterranean the physical remnants of a vast maritime infrastructure that sustained and connected the western world s first global empire and economy the key to this incredible accomplishment and to the survival of structures in the hostile environment of the sea for two thousand years was maritime concrete a building material invented and then employed by roman builders on a grand scale to construct harbor installations anywhere they were needed rather than only in locations with advantageous geography or topography this book explains how the romans built so successfully in the sea with their new invention the story is a stimulating mix of archaeological geological historical and chemical research with relevance to both ancient and modern technology it also breaks new ground in bridging the gap between science and the humanities by integrating analytical materials science history and archaeology along with underwater exploration the book will be of interest to anyone interested in roman architecture and engineering and it will hold special interest for geologists and mineralogists studying the material characteristics of pyroclastic volcanic rocks and their alteration in seawater brines the demonstrable durability and longevity of roman maritime concrete structures may be of special interest to engineers working on cementing materials appropriate for the long term storage of hazardous substances such as radioactive waste a pioneering methodology was used to bore into maritime structures both on land and in the sea to collect concrete cores for testing in the research laboratories of the ctg italcementi group a leading cement producer in italy the university of berkeley and elsewhere the resulting mechanical chemical and physical analysis of 36 concrete samples taken from 11 sites in italy and the eastern mediterranean have helped fill many gaps in our knowledge of how the romans built in the sea to gain even more knowledge of the ancient maritime

technology the directors of the roman maritime concrete study romacons engaged in an ambitious and unique experimental archaeological project the construction underwater of a reproduction of a roman concrete pier or pila the same raw materials and tools available to the ancient builders were employed to produce a reproduction concrete structure that appears to be remarkably similar to the ancient one studied during romacons fieldwork between 2002 2009 this volume reveals a remarkable and unique archaeological project that highlights the synergy that now exists between the humanities and science in our continuing efforts to understand the past it will quickly become a standard research tool for all interested in roman building both in the sea and on land and in the history and chemistry of marine concrete the authors also hope that the data and observations it presents will stimulate further research by scholars and students into related topics since we have so much more to learn in the years ahead

in a field as rapidly expanding as digital signal processing even the topics relevant to the basics change over time both in their nature and their relative importance it is important therefore to have an up to date text that not only covers the fundamentals but that also follows a logical development that leaves no gaps readers must somehow bridge by themselves digital signal processing with examples in matlab is just such a text the presentation does not focus on dsp in isolation but relates it to continuous signal processing and treats digital signals as samples of physical phenomena the author also takes care to introduce important topics not usually addressed in signal processing texts including the discrete cosine and wavelet transforms multirate signal processing signal coding and compression least squares systems design and adaptive signal processing he also uses the industry standard software matlab to provide examples of signal processing system design spectral analysis filtering coding and compression and exercise solutions all of the examples and functions used in the text are available online at crcpress com designed for a one semester upper level course but also ideal for self study and reference digital signal processing with examples in matlab is complete self contained and rigorous for basic dsp it is quite simply the only book you need

this text is appropriate for severe or multiple disabilities methods courses this text provides comprehensive coverage of all the issues pertinent to teaching students with severe disabilities covering both methodology and curricular areas topics are presented in the chronological order in which a teacher would approach them prior considerations planning and assessment general instructional procedures and finally procedures specific to teaching specific skills

filling a long recognized need to help social workers develop a multicultural world view that responds to the increasingly complex environments in which they work with clients this volume explores how the theoretical perspective of the ecosystem has been applied in the delivery of culturally competent social work services in a wide variety of fields of practice and settings
