the title high dimensional probability is used to describe the many tributaries of research on gaussian processes and probability in banach spaces that started in the early 1970s many of the problems that motivated researchers at that time were solved but the powerful new tools created for their solution turned out to be applicable to other important areas of probability they led to significant advances in the study of empirical processes and other topics in theoretical statistics and to a new approach to the study of aspects of lévy processes and markov processes in general the papers in this book reflect these broad categories the volume thus will be a valuable resource for postgraduates and reseachers in probability theory and mathematical statistics

as the cost of high throughput sequencing goes down huge volumes of biological and medical data have been produced from various sequencing platforms at multiple molecular levels including genome transcriptome proteome epigenome metabolome and so on for a long time data analysis on single molecular levels has paved the way to answer many important research questions however many aging related neuronal diseases arnds and central nervous system cns aging involve interactions of molecules from multiple molecular levels in which conclusions based on single molecular levels are usually incomplete and sometimes misleading in these scenarios multi omics data analysis has unprecedentedly helped capture much more useful information for the diagnosis treatment prognosis and drug discovery of arnds the first step towards a multi omics analysis is to establish reliable and robust multi omics datasets in the past years a few important arnds associated multi omics databases like allen brain have been constructed which raised immediate needs like data curation normalization interpretation and visualization for integrative multi omics explorations though there have been several well established multi omics databases for arnds like alzheimer s disease similar databases for other arnds are still in urgent need after the databases establish many computational tools and experiential strategies should be developed specifically for them first the multi omics data are usually extremely noisy complex heterogeneous and in high dimension which presents the need for appropriate denoising and dimension reduction methods second since the multi omics and non omics data like pathological and clinical data are usually in different data spaces a useful algorithm to mapping them into the same data space and integrate them is nontrivial in the multi omics era there are numerous data centric tools for the integration of multi omics datasets which could be generally divided into three categories unsupervised supervised and semi supervised methods commonly used algorithms include but not limited to bayesian based
