PhyloCode is an implementation of PhyloCode which is a set of principles, rules and recommendations governing phylogenetic nomenclature. Nearly 300 clades/lineages of organisms are defined by reference to hypotheses of phylogenetic history rather than by taxonomic ranks and types. This volume will document the real-world uses of PhyloCode and will govern and apply to the names of clades while species names will still be governed by traditional codes. Key features provide clear regulations for implementing new guidelines for naming lineages of organisms; incorporates expressly evolutionary and phylogenetic principles; works with existing codes of nomenclature; eliminates the reliance on rank-based classification in favor of phylogenetic relationships. Roads may threaten the persistence of wildlife populations by acting as barriers to movement and/or sources of increased mortality across the landscape. Amphibians and reptiles have been identified as being particularly susceptible to negative road impacts. Many species migrate annually among habitats to support basic life history requirements such as breeding, development, foraging and overwintering. For these species, individuals may need to successfully cross roads multiple times each year for the population to persist. Many are slow moving and freeze in the presence of danger, making it almost impossible for them to avoid oncoming vehicles. Although there are a plethora of road mortality location and count data, the effects of road mortality on the long-term viability of amphibian and reptile populations and metapopulations are mostly unknown due to a lack of information on their abundance, vital rates, behavior and spatial and temporal dynamics.
