parts of the world are extensive ranging from reptiles through rodents to ruminants and

beyond as would be predicted by the nature of the relationship the approach to treatment of a companion animal is often closely aligned to that which would have been offered to their owner however an increasing awareness of welfare issues such as the recognition that animals experience pain and the proven benefits of disease prevention in intensive farming units together with the growth in zoos and wildlife parks has increased the likelihood of food producing and non domesticated animals receiving medicinal products during their life time although many of the individual drugs or classes of drugs administered to animals are the same as or derived from those given to man the safe and effective use of drugs in animals often cannot be achieved by simply transposing knowledge of drug action on or behaviour in the body from one species to another the impact of the anatomical physiological and pathophysiological variability that spans the animal kingdom can often profoundly alter drug response
