a mathematical model of coupled heat and moisture flow in soils have been developed the model includes algorithms for phase change of soil moisture and frost heave and permits several types of boundary and initial conditions the finite element method of weighted residuals galerkin procedure was chosen to simulate the spatial regime and the crank nicholson method was used for the time domain portion of the model to facilitate evaluation of the model the heat and moisture fluxes were essentially decoupled moisture flux was then simulated accurately as were heat flux and frost heave in a laboratory test
