management in the 21st century the quest for sustainable energy developed societies require an ever increasing amount of energy resources which creates complex technological  
challenges the idea is to compare conventional energy sources particularly hydrocarbons with a number of other ways of producing energy emphasising new technological  
developments the challenge in many cases is the conversion of new sources of energy into useful forms while finding efficient ways of storing and distributing energy energy policies  
and management are of primary importance to achieving sustainability and need to be consistent with recent advances made in energy production and distribution the book will also  
discuss the energy use of industrial processes including the imbedded energy contents of materials particularly those in the built environment energy production distribution and usage  
result in environmental risks which need to be better understood they are part of the energy economics and relate to human environmental health as well as ecosystems behaviour  
topics covered include energy production energy management energy policies energy and economic growth energy efficiency hydropower wind energy solar energy nuclear energy

a comprehensive overview of the theory of stochastic processes and its connections to asset pricing accompanied by some concrete applications this book presents a self contained  
comprehensive and yet concise and condensed overview of the theory and methods of probability integration stochastic processes optimal control and their connections to the

principles of asset pricing the book is broader in scope than other introductory level graduate texts on the subject requires fewer prerequisites and covers the relevant material at greater depth mainly without rigorous technical proofs the book brings to an introductory level certain concepts and topics that are usually found in advanced research monographs on stochastic processes and asset pricing and it attempts to establish greater clarity on the connections between these two fields the book begins with measure theoretic probability and integration and then develops the classical tools of stochastic calculus including stochastic calculus with jumps and lévy processes for asset pricing the book begins with a brief overview of risk preferences and general equilibrium in incomplete finite endowment economies followed by the classical asset pricing setup in continuous time the goal is to present a coherent single overview for example the text introduces discrete time martingales as a consequence of market equilibrium considerations and connects them to the stochastic discount factors before offering a general definition it covers concrete option pricing models including stochastic volatility exchange options and the exercise of american options merton's investment consumption problem and several other applications the book includes more than 450 exercises with detailed hints appendixes cover analysis and topology and computer code related to the practical applications discussed in the text

concurrent and distributed processes occur everywhere in embedded systems in information networks and databases and in the form of applets roaming around on the world wide this book presents and develops state of the art validation techniques for detecting safety violations the focus is on the correctness of techniques that suffice for fully automatic validation of key components of such systems it builds on and extends the notion of types popular in many sequential programming languages as a technique for catching certain kinds of errors already at program development time by incorporating behaviours or structured effects that are able to track the information flow in the presence of procedures channel based communication and the dynamic creation of network topologies the technical development is performed for a language based on concurrent ml
