the environmental analysis of pollution problems always involves the use of mass and energy balances to quantify the extent of pollution and its sources this same form of analysis can be applied to ecosystems production systems a whole country or a region a systems approach to the environmental analysis of pollution minimization identifies and describes the common factors shared by these systems the book is organized in twelve chapters and progresses from general concepts to specific assessment methods chapter one is a general introduction to environmental management principles chapter two discusses conservation principles and their applications to environmental health chapters three and four explore ecosystem health properties and analysis chapters five through eleven present different methods of analysis including green accounting clean technology life cycle analysis and risk assessment editor sven jorgensen closes the book with a sweeping summary jorgensen is a internationally published authority on the use and analysis of ecosystem models his new book is a comprehensive guide for both students and professionals a systems approach to the environmental analysis of pollution minimization is an invaluable contribution features

a systems approach to small group interaction pioneered the systems approach and is the only book that integrates all important small group topics into a single comprehensive conceptual model the text also features a unique systematic organization each chapter begins with a brief preview followed by a glossary of terms a real life case study and then the chapter text material next comes several experiential exercises for skill development and finally the chapter concludes with two original readings

the few models on safety management that are available tend to explain a procedure to manage safety rather than a safety management system the research carried out here however models

safety management by transforming a common procedural model i.e. the hse s model 1997 into a functional systems representation the overall goal of the model is to offer clear graphic lines of influence of its different components on organisational safety the model is innovative not in the components that it considers but in the representation of those components which details relative distances between elements and therefore opens doors to model driven hypotheses which account for those distances therefore hypotheses are more accurate in their predictions this model is firstly explored in the construction sector results from this exploratory research support the adequacy of the model to understanding safety management and encourage future research of a more confirmatory nature
