the study of complex dynamic processes governed by nonlinear and nonstationary characteristics is a problem of great importance in the analysis and control of power system oscillatory behavior power system dynamic processes are highly random nonlinear to some extent and intrinsically nonstationary even over short time intervals as in the case of severe transient oscillations in which switching events and control actions interact in a complex manner phenomena observed in power system oscillatory dynamics are diverse and complex measured ambient data are known to exhibit noisy nonstationary fluctuations resulting primarily from small magnitude random changes in load driven by low scale motions or nonlinear trends originating from slow control actions or changes in operating conditions forced oscillations resulting from major cascading events on the other hand may contain motions with a broad range of scales and can be highly nonlinear and time varying prediction of temporal dynamics with the ultimate application to real time system monitoring protection and control remains a major research challenge due to the complexity of the driving dynamic and control processes operating on various temporal scales that can become dynamically

involved an understanding of system dynamics is critical for reliable inference of the underlying mechanisms in the observed oscillations and is needed for the development of effective wide area measurement and control systems and for improved operational reliability

complex computer integrated systems offer enormous benefits across a wide array of applications including automated production transportation concurrent software and computer operating systems computer networks distributed database systems and many other automated systems yet as these systems become more complex automated distributed and computing intensive the opportunity for deadlock issues rises exponentially deadlock modeling detection avoidance and recovery are critical to improving system performance deadlock resolution in computer integrated systems is the first text to summarize and comprehensively treat this issue in a systematic manner consisting of contributions from prominent researchers in the field this book addresses deadlock free models and scheduling detection and recovery methods the formulation of dynamic control policies and comparison and industrial benchmark studies that evaluate various approaches the editors lay the foundation for exploring deadlock issues with a typical example of an automated manufacturing process illustrating three primary modeling methods digraphs petri nets and automata and comparing their respective advantages and disadvantages providing all of the important models and resolution approaches this book is the complete guide for electrical and control engineers and manufacturing intelligent and network systems designers to prevent and manage deadlock issues in their systems
