the critical step in the use of mathematics for solving real world problems is the building of a suitable mathematical model this

book advocates a novel approach to the teaching of the building process for mathematical models with emphasis on the art as well as the science aspects using a case study approach the book teaches the mathematical modelling process in a comprehensive framework presenting an overview of the concepts and techniques needed for modelling the book is structured in three parts the first dealing with the science aspect the second dealing with the art aspects and the third combining self learning exercises for the student and supplementary resource material for the instructor

environmental issues is one of the significantly important subjects to be solved on a global scale for attaining sustainable developments in the new century a major feature of environmental issues is that studies on environments are interdisciplinary and should deal with complex and heterogeneous systems which include chemical physical and biological phenomena and further socio economical activities and technology developments for energy saving and co 2 emission reduction the workshop provided the forum for presentation of new developments in the important interdisciplinary field of environmental systems involving the application of concepts methods and techniques of modeling and control the aim was to review state of the art systems and control approaches exchange new results in interdisciplinary fields and look at feasible developments to the future the scope of this workshop covered various aspects of systems and control approaches to environmental issues environmental assessment systems approaches to environmental management and strategies modeling of global warming and impact analysis on socio structure modeling of ecological systems control and optimization of environmental quantities system reform and integration for environments advanced control technology for reduction of energy consumption and co 2 emission cogeneration systems control systems approaches to clean energy fuel cells and their applications systems integration technologies in urban planning systems modeling and data analysis in life cycle assessment manufacturing in symbiosis with environments modeling and control of waste incineration plant water quality control and waste water management other related topics

this thesis focuses on routing in wired and wireless segments of the internet using partial link state information although efficient algorithms have been proposed based on both link state and distance vector information link state routing is more efficient than distance vector routing when constraints are placed on the paths offered to destinations which is the case for qos routing offering paths with required delay bandwidth reliability cost or other parameters we present a new link state routing protocol for wired internetworks called alp adaptive link state protocol in alp a router sends updates to its neighbors regarding the links in its preferred paths to destinations each router decides which links to report to its neighbors based on its local computation of preferred paths a router running alp does not ask its neighbors to delete links instead a router simply updates its neighbors with the most recent information about those links it decides to take out of its preferred paths we introduce and

analyze two routing algorithms for wireless networks the source tree adaptive routing star protocol and the neighborhood aware source routing nsr protocol star is the first example of a table driven routing protocol that is more efficient than prior table driven and on demand routing protocols by exploiting link state information to allow paths taken to destinations to deviate from the optimum in order to save bandwidth without creating loops nsr is an on demand routing protocol based on partial topology information and source routing star is shown to be more efficient than the dynamic source routing dsr protocol in small ad hoc networks and nsr is shown to outperform star and dsr in large wireless networks with mobile nodes
