direct current dc motors have variable characteristics and are used extensively in variable speed drives dc motor can provide a high starting torque and it is also possible to obtain speed control over wide range why do we need a seed motor controller for example if we have a dc motor in a robot if we just apply a constant power to each motor on a robot then the poor robot will never be able to maintain a steady speed it will go slower over carpet faster over smooth flooring slower up hill faster down hill etc so it is important to make a controller to control the speed of dc motor in desired speed dc motor plays a significant role in modern industrial these are several types of applications where the load on the dc motor varies over a speed range these applications may demand high speed control accuracy and good dynamic responses in home applications washers dryers and compressors are good example in automotive fuel pump control electronic steering control engine control and electric vehicle control are good examples of these in aerospace there are a number of applications like centrifuges pumps robotic arm controls gyroscope controls and so on
