abstract deadlock detection is an elementary problem in computer science yet algorithms for detecting deadlocks over resources in a distributed system are curiously prone to errors this anomaly calls for a theory that will help us understand existing algorithms and design new algorithms surprisingly most papers in the literature have either no definition of what a deadlock is or a bad definition this fact itself accounts for many of the errors the first task in developing a theory is therefore to choose an appropriate definition for a deadlock

the paper presents a study of the problem of system deadlock with emphasis on the allocation of serially reusable resources the initial area of concentration is on a definition of system deadlock and a presentation of proven methods of handling deadlock after the discussion of current theory two major operating systems are examined an overall description of the functioning of os 360 is presented followed by a detailed discussion of the procedures used by os 360 to allocate serially

reusable resources the michigan terminal system is then discussed outlining the techniques of resource allocation employed the paper is concluded by correlating the methods used in os 360 with those of mis author
